

CCAO-F Practice Tests & Flashcards

Claude Certified Associate: Foundations (Panaversity PCAO-F) — 10 Agent Factory crash courses

188 scenario MCQs + 37 flashcards, every item in **English** and *Roman Urdu*, with the correct answer and explanation in both languages.

#	Course	MCQs	Flashcards
1	Just Delegate It	12	10
2	What AI Actually Is	0	9
3	AI Fluency (The 4Ds)	12	10
4	AI Prompting in 2026	30	0
5	Claude & ChatGPT 101	12	8
6	Skills & Connectors	29	0
7	General Agents on the Web	28	0
8	Workflow Design & Diagnosis	12	0
9	Governance, Risk & Responsible Use	21	0
10	Code You Never Write	32	0
	Total	188	37

How to use / Kaise istemal karein: Pehle jawab khud sochein, phir hara (green) jawab aur wazahat parhein. Answer from the reasoning, not from the longest option — lambe option ko sahi na samjhein.

Note: MCQs are taken from each course's "Test Your Understanding" quiz. The interactive flashcard widget is not published as text, so the flashcards here come from each course's "Quick self-check" (Courses 1, 3, 5) and the "Nine ideas" list (Course 2). Courses 4, 6–10 have no self-check text, so they are MCQ-only.

Course 1: Just Delegate It

<https://agentfactory.panaversity.org/docs/just-delegate-it-crash-course>

Practice Test — 12 MCQs

Q1. Sana types 'What are the best free tools for making a CV?' and gets a good list. She then opens each tool, compares them, and picks one. Which step did she keep that she could have delegated?

Sana ne likha 'CV banane ke behtareen free tools kaun se hain?' aur achhi list mili. Phir usne har tool khola, compare kiya aur aik chuna. Kaunsa step usne apne paas rakha jo delegate ho sakta tha?

A) Verifying that the tools exist, which the assistant could have done by opening each page and confirming it is still live today

Tools ke mojud hone ki tasdeeq — assistant har page khol kar check kar sakta tha

B) Deciding which tool to use, since a recommendation from the assistant would have settled the choice for her

Kaunsa tool lena hai yeh faisla — assistant ki recommendation faisla kar deti

C) The comparison itself, because the question returned advice and a job asking for a table with links would have moved it

Khud comparison — sawal ne sirf mashwara diya; 'links ke saath table' wala job yeh kaam AI ko de deta

D) Choosing free tools, because the assistant could have filtered by price before she had to look at anything

Free tools chunna — assistant qeemat ke hisaab se pehle filter kar sakta tha

✓ **Correct answer / Sahi jawab: C**

Explanation: The question returned advice, so the comparison stayed with her. A job, 'compare three free CV tools in a table with links', would have moved it. Verifying the tools exist and making the final decision are hers to keep.

Wazahat: Sawal ne sirf mashwara diya, is liye comparison uske paas reh gaya. Agar job deti — 'teen free CV tools ko links ke saath table mein compare karo' — to yeh kaam AI karta. Tasdeeq aur aakhri faisla uske apne hain.

Q2. Bilal writes: 'Go to two job sites, open the ten newest listings for data entry, copy the salary from each, and tell me the average.' The assistant returns a neat table with an average. What is the most likely problem?

Bilal likhta hai: 'Do job sites par jao, data entry ki das nayi listings kholo, har aik ki salary copy karo aur average batao.' Assistant saaf table aur average deta hai. Sab se mumkin masla kya hai?

- A) The assistant cannot do arithmetic reliably, so an average computed from ten listings should never be trusted
Assistant hisaab theek nahi kar sakta, is liye average par kabhi bharosa na karein
- B) He gave a recipe, so the result is only as good as the two sites he chose, and nothing in the result tells him so
Usne recipe di — nateeja utna hi achha hai jitni woh do sites, aur nateeja yeh nahi batata
- C) He should have asked for a chart instead of a table, because a picture of the salaries would have exposed the spread between the listings
Table ki jagah chart maangna chahiye tha taake salaries ka farq nazar aata
- D) He forgot to say which currency to use, so the average may mix figures that cannot be added together
Currency batana bhool gaya, average mein mukhtalif currencies mil sakti hain

✓ **Correct answer / Sahi jawab: B**

Explanation: A recipe limits the result to the quality of the plan, and a wrong step is followed faithfully. An outcome, such as 'the typical salary for data entry roles posted this month, with sources', lets AI choose where to look.

Wazahat: Recipe (steps) dene se nateeja aapke plan jitna hi achha hota hai; ghalat step bhi wafadari se follow hota hai. Outcome dein — 'is mahine data entry ki aam salary, sources ke saath' — to AI khud chunta hai kahan dekhna hai.

Q3. A brief has outcome, context, constraints, and deliverable, and the result recommends a paid course without saying it is paid. Which missing line caused this?

Brief mein outcome, context, constraints aur deliverable hain, aur nateeja aik paid course recommend karta hai bina bataye ke woh paid hai. Kaunsi missing line is ki wajah bani?

- A) Verification, because a line saying what would be checked would have made the assistant flag the price itself
Verification — kya check hoga yeh line hoti to assistant khud qeemat flag karta
- B) A longer context line, because the assistant did not know enough about the reader to rule out paid courses
Lamba context — assistant reader ke baare mein kam jaanta tha
- C) A stricter deliverable line, because a column for price in the table would have forced the fact into the open for the reader
Sakht deliverable — table mein price ka column hota to baat saamne aati
- D) Authority, because 'say clearly if a course is paid' is a limit on it, and without it AI decided for the reader silently
Authority — 'saaf batao agar course paid hai' AI ke ikhtiyar ki had hai; iske baghair AI ne chupke se faisla kar liya

✓ **Correct answer / Sahi jawab: D**

Explanation: 'Say clearly if a course is paid' is a limit on authority. Without that line, AI decided for the reader silently, and the reader never learned that a decision was made.

Wazahat: 'Saaf batao agar course paid hai' — yeh authority (ikhtiyar) ki had hai. Is line ke baghair AI ne reader ki jagah chupke se faisla kiya aur reader ko pata bhi na chala.

Q4. Aisha's result lists three courses with confident descriptions and no links or dates. What does this tell her?

Aisha ke nateeje mein teen courses hain, pur-aitmaad descriptions ke saath, lekin koi link ya date nahi. Is se use kya pata chalta hai?

- A) The assistant probably answered from what it remembered rather than from a search, and she should not assume it looked
Assistant ne shayad yaad se jawab diya, search se nahi — yeh na samjhein ke usne dekha
- B) The courses probably do not exist, because a real course would have produced a link the assistant could show
Courses shayad mojood hi nahi, warna link hota
- C) The assistant is broken and she should start a new chat, because search normally attaches a link and a date to every fact
Assistant kharab hai, nayi chat shuru karein
- D) Nothing in particular, because confident descriptions are enough to act on when the courses are well known
Kuch khaas nahi — mashhoor courses ke liye pur-aitmaad description kaafi hai

✓ **Correct answer / Sahi jawab: A**

Explanation: A found fact should arrive with a source you can open. A remembered one arrives alone and sounds just as sure. The next step is to make it look, then trace one claim and find its date.

Wazahat: *Dhoondi hui baat aise source ke saath aati hai jo aap khol sakein. Yaad ki hui baat akeli aati hai aur utni hi pakki lagti hai. Agla qadam: AI se search karwayein, phir aik claim trace karke uski date dekhein.*

Q5. Usman pastes a notice and asks three questions about it. The assistant answers all three fluently, and one answer describes a deadline that is not in the notice. What did the brief lack?

Usman aik notice paste karke teen sawal poochta hai. Assistant teenon ka rawani se jawab deta hai, aur aik jawab mein aisi deadline hai jo notice mein nahi. Brief mein kya kami thi?

- A) A shorter notice, because a long paste makes the assistant lose track of which sentence answers which question
Chhota notice — lambi paste se assistant bhatak jata hai
- B) A request for a table, because answers laid out in rows are checked more carefully than answers in paragraphs
Table ki darkhwast — rows wale jawab zyada dhyan se check hote hain
- C) 'Use only the text below' and 'quote the sentence you used', so that 'not in the source' becomes the right answer
'Sirf neeche wala text use karo' aur 'jo jumla use kiya woh quote karo' — taake 'source mein nahi' sahi jawab ban sake
- D) Web search, because the deadline was probably published somewhere online and the assistant should have gone and found it there first
Web search — deadline shayad online kahin chhapi thi

✓ **Correct answer / Sahi jawab: C**

Explanation: Without those two instructions, AI mixes the source with what it remembers. With them, 'not in the source' becomes the right answer for the deadline instead of a gap AI fills for you.

Wazahat: *In do hidayaat ke baghair AI source aur apni yaad ko mila deta hai. Inke saath 'source mein nahi' deadline ka sahi jawab ban jata hai, warna AI khud khaali jagah bhar deta hai.*

Q6. A chat answer carried two 'unverified' marks. The one-page document made from it carries none. What happened, and what should the reader do?

Chat ke jawab mein do 'unverified' nishan the. Us se bane aik page ke document mein koi nahi. Kya hua, aur reader ko kya karna chahiye?

A) The facts were verified during formatting, so there is nothing to do and the document can be sent as it is

Formatting ke dauran facts verify ho gaye, kuch karne ki zaroorat nahi

B) Deliverables lose caveats, so find the two marks and put them back before the document leaves the chat

Deliverables mein caveats (ehtiyaati note) gum ho jate hain — dono nishan dhoond kar wapas lagayein

C) The document is wrong and should be rejected, because a deliverable that changed cannot be trusted

Document ghalat hai, reject karein

D) Ask for a longer document, because the marks were dropped to fit the page and more room will bring them back

Lamba document maangein, jagah milne par nishan wapas aa jayenge

✓ **Correct answer / Sahi jawab: B**

Explanation: Tidy is what a document is for, and caveats are the first casualty. Count them before and after, and put back what was dropped.

Wazahat: Document ka kaam saaf suthra dikhna hai, aur caveats sab se pehle gum hote hain. Pehle aur baad mein gin lein, aur jo gira use wapas lagayein.

Q7. Hira asks for a plan first, approves it, and then finds the result used a source that was not in the plan. Which loop step is this concept training, and what is the right response?

Hira pehle plan maangti hai, manzoor karti hai, phir dekhti hai ke nateeje mein aisa source use hua jo plan mein nahi tha. Yeh concept loop ka kaunsa step sikhata hai, aur sahi jawab kya hai?

A) Accept, because the result is fine and the extra source only means the assistant was being thorough

Accept — nateeja theek hai, extra source sirf mehnat ka nishan hai

B) Define, because a plan that changed means the outcome was never clear enough and should be rewritten from the start

Define — plan badla matlab outcome saaf nahi tha, shuru se likhein

C) Verify, because the right move is to trace the new source, confirm it is good, and move on with the result

Verify — naya source trace karein, theek ho to aage barhein

D) Observe and Intervene, because every difference between the approved plan and what happened is a question to ask

Observe aur Intervene — manzoor plan aur asal kaam mein har farq aik sawal hai

✓ **Correct answer / Sahi jawab: D**

Explanation: Plan-first is how you observe a job you cannot watch. A plan approved and then changed without telling you is exactly what the concept exists to catch.

Wazahat: Pehle plan maangna us kaam ko 'observe' karne ka tareeqa hai jo aap dekh nahi sakte. Manzoor plan ka baghair bataye badal jana wahi cheez hai jise yeh concept pakadta hai.

Q8. For the third week running, Omar pastes the same two paragraphs of background before his weekly summary job. What does the course say this is a sign of?

Teesre hafte mein bhi Omar weekly summary job se pehle wahi do paragraph background paste karta hai. Course ke mutabiq yeh kis baat ki nishani hai?

- A) The context belongs in a Project or a saved note he pastes first, so the job needs one message instead of three
Yeh context Project ya saved note mein hona chahiye, taake job aik message mein ho
- B) The job is too hard for AI, because a task that needs two paragraphs of setup every single time is not a delegation
Job AI ke liye mushkil hai
- C) He should switch assistants, because one that needed the background every week has no memory worth using
Assistant badal lein, iski memory bekaar hai
- D) He should shorten the background, because two paragraphs is more context than a weekly summary can use
Background chhota karein, do paragraph zyada hain

✓ **Correct answer / Sahi jawab: A**

Explanation: The third time you paste the same background, put it somewhere AI reads by itself. Sources as knowledge, rules as standing instructions, today's job in the chat.

Wazahat: *Teesri baar wahi background paste karein to use aisi jagah rakhein jahan AI khud parhe. Sources knowledge mein, qawaid standing instructions mein, aur aaj ka kaam chat mein.*

Q9. A result is wrong in one figure. The reader replies 'Redo the whole thing.' Which move would the course prefer, and why?

Nateeje mein sirf aik figure ghalat hai. Reader kehta hai 'Poora dobara karo.' Course kaunsa qadam pasand karega aur kyun?

- A) Stop, because a wrong figure means the job itself was wrong and the outcome needs restating in one line
Stop — ghalat figure matlab poora job ghalat tha
- B) Escalate to a stronger model, because a figure that came out wrong means the level was too low for the whole of the job
Taaqatwar model par escalate karein
- C) Correct: name the error and what should replace it, because the smallest message that fixes it is the intervention
Correct — ghalti aur uski jagah sahi cheez batayein; sab se chhota message jo theek kare wahi intervention hai
- D) Take the job back, because a result with an error in it has shown that this job belongs with the reader
Job wapas le lein — ghalti ne dikha diya ke yeh kaam reader ka hai

✓ **Correct answer / Sahi jawab: C**

Explanation: One wrong figure calls for a correction, not a rewrite. A rewrite throws away everything that was right.

Wazahat: *Aik ghalat figure ke liye correction chahiye, poora rewrite nahi. Rewrite woh sab bhi phenk deta hai jo sahi tha.*

Q10. Zara's result has fourteen facts. She has ten minutes. What does the Identify step tell her to do?

Zara ke nateeje mein chaudah facts hain aur uske paas das minute hain. Identify step use kya karne ko kehta hai?

- A) Check all fourteen quickly, because a fast pass over everything catches more than a slow pass
Sab chaudah jaldi check karein
- B) Check the ones that matter most, such as prices, dates, and the recommendation she will act on
Jo sab se ahem hain woh check karein — qeematein, tareekhein, aur woh recommendation jis par amal karna hai
- C) Check the first three, because errors cluster near the start of a result where the assistant was still settling in
Pehle teen check karein, ghaltiyan shuru mein hoti hain
- D) Ask the assistant which ones to check, because it knows which facts it was least sure about when it wrote them
Assistant se poochein kaunse check karein

✓ **Correct answer / Sahi jawab: B**

Explanation: Spend checking where an error would cost you. Not everything, and not at random.

Wazahat: Checking wahan karein jahan ghalti mehngi pade. Sab kuch nahi, aur na hi andaaze se.

Q11. The assistant cited a page for a claim. Ali opened the page and found it says something slightly different. Which decision fits, and why?

Assistant ne aik claim ke liye page cite kiya. Ali ne page khola to wahan thodi mukhtalif baat likhi thi. Kaunsa faisla theek hai aur kyun?

- A) Accept, because there is a citation and a page that is slightly different still counts as support for the claim
Accept — citation to hai, thoda farq chalta hai
- B) Reject the whole result, because one bad citation means none of the others can be trusted
Poora nateeja reject karein
- C) Ask for another citation and accept that one, because a second page is more likely to say what the claim says
Doosri citation maang kar use maan lein
- D) Correct or Investigate, because a citation is not verification and the sentence did not support the claim
Correct ya Investigate — citation verification nahi hai, aur jumla claim ko support nahi karta

✓ **Correct answer / Sahi jawab: D**

Explanation: Checking the citation is verification. A specific mismatch is a correction. If it is unclear which is right, investigate.

Wazahat: Citation ko khud check karna verification hai. Wazeh farq ho to correction; agar saaf na ho ke kaun sahi hai to investigate karein.

Q12. Maryam ran the same brief in two assistants on the same afternoon. One finished in two messages, the other in four. She writes 'Assistant A is better.' What does the course say?

Maryam ne aik hi brief do assistants mein aik hi dopahar chalaya. Aik ne do messages mein kaam kiya, doosre ne chaar mein. Woh likhti hai 'Assistant A behtar hai.' Course kya kehta hai?

A) She has an observation about two runs on one day, not a ranking, and it belongs in her Delegation Record as such

Yeh aik din ke do runs ka mushahida hai, ranking nahi — Delegation Record mein isi tarah likhein

B) She is right, and should use Assistant A from now on, because finishing in fewer messages is the measure that matters

Woh sahi hai, ab A hi use kare

C) She should run it ten more times in each assistant, because a ranking needs a larger sample before it can be trusted

Har assistant mein das baar aur chalaye

D) She should change the brief, because a brief that takes four messages in one assistant was not written clearly

Brief badle, chaar messages matlab brief saaf nahi tha

✓ **Correct answer / Sahi jawab: A**

Explanation: Models change too fast for one day's runs to rank them. Record what happened. The job belongs to her, and the model is replaceable.

Wazahat: Models itni tezi se badalte hain ke aik din ke runs se ranking nahi banti. Jo hua woh likhein. Kaam uska hai, model badla ja sakta hai.

Flashcards — 10 cards

Card 1. What is the difference between asking AI and giving AI a job?

AI se poochne aur AI ko job dene mein kya farq hai?

Answer: Asking gets you an answer and leaves the next steps with you. Giving a job asks for a thing to exist and leaves you the checking.

Jawab: Poochne se jawab milta hai aur agle qadam aapke paas rehte hain. Job dene se cheez ban kar milti hai aur aapke paas sirf checking bachti hai.

Card 2. Name the six steps of the Delegation Loop, and say which steps stay yours.

Delegation Loop ke chhe steps batayein, aur kaunse aapke paas rehte hain?

Answer: Define, delegate, observe, intervene, verify, accept. Both ends stay yours: define and delegate at the start, verify and accept at the end. AI can help with them. It cannot take them.

Jawab: Define, delegate, observe, intervene, verify, accept. Dono kinare aapke: shuru mein define/delegate, aakhir mein verify/accept. AI madad kar sakta hai, le nahi sakta.

Card 3. Why does describing the outcome usually beat dictating the steps?

Outcome batana steps likhane se behtar kyun hai?

Answer: A recipe limits the result to the quality of your plan, and AI cannot tell you the plan was narrow. An outcome lets AI choose the method and lets you judge the result against what you asked for.

Jawab: Recipe nateeje ko aapke plan tak mehdood kar deti hai, aur AI nahi batata ke plan tang tha. Outcome se AI tareeqa chunta hai aur aap nateeje ko apni maang se jaanchte hain.

Card 4. Name the six lines of a Delegation Brief. Which two do people skip?

Delegation Brief ki chhe lines batayein. Log kaunsi do chhod dete hain?

Answer: Outcome, context, constraints, authority, deliverable, verification. Authority and verification are the two people skip.

Jawab: Outcome, context, constraints, authority, deliverable, verification. Authority aur verification aksar chhoot jati hain.

Card 5. How can you tell whether a fact came from searching or from remembering?

Kaise pata chale ke fact search se aaya ya yaad se?

Answer: A found fact should arrive with a source you can open. A remembered fact arrives alone, and sounds just as sure. No source, do not assume it looked. And a source is not a date: find the date on the page yourself.

Jawab: Dhoonda hua fact khulne wale source ke saath aata hai; yaad wala akela aata hai aur utna hi pakka lagta hai. Source nahi to na samjhein ke dekha. Aur source date nahi — date page par khud dekhein.

Card 6. What two instructions turn pasted text into a source?

Kaunsi do hidayaat paste kiye gaye text ko source bana deti hain?

Answer: "Use only the text below" and "quote the sentence you used". Together they make "not in the source" a good answer.

Jawab: 'Sirf neeche wala text use karo' aur 'jo jumla use kiya quote karo'. Dono mil kar 'source mein nahi' ko achha jawab bana deti hain.

Card 7. What is the cheapest moment to fix a job, and how do you get to it?

Job theek karne ka sab se sasta waqt kaunsa hai, aur wahan kaise pahunchen?

Answer: Before the run. Ask for the plan and wait for your go-ahead, then change one step.

Jawab: Run se pehle. Plan maangein, apni ijazat tak rukwayein, phir aik step badlein.

Card 8. What does repetition ask for, and what is the sign that context belongs in a Project?

Baar baar ka kaam kya maangta hai, aur kab context Project mein jana chahiye?

Answer: Repetition asks for the context you keep retyping and, later, for a clock. The third time you paste the same background, it belongs in a Project.

Jawab: Repetition us context ko maangti hai jo aap baar baar likhte hain, aur baad mein schedule (clock) ko. Teesri baar wahi background paste ho to woh Project mein jaye.

Card 9. Name the six moves of Intervene. Which one do people miss?

Intervene ke chhe moves batayein. Log kaunsa bhool jate hain?

Answer: Stop, correct, redirect, change the requirement, escalate capability, take the job back. Escalate is the one people miss: sometimes "AI failed" means "I used the wrong level".

Jawab: Stop, correct, redirect, requirement badlein, capability escalate karein, job wapas lein. Escalate bhool jate hain: kabhi 'AI fail hua' ka matlab 'maine ghalat level use kiya' hota hai.

Card 10. What are the four steps of verification and the four decisions it ends in?

Verification ke chaar steps aur chaar faislay kya hain?

Answer: Identify, trace, challenge, decide. Accept, correct, investigate, reject.

Jawab: Steps: Identify, trace, challenge, decide. Faislay: Accept, correct, investigate, reject.

Course 2: What AI Actually Is

<https://agentfactory.panaversity.org/docs/what-ai-actually-is-crash-course>

Flashcards — 9 cards

Card 1. What does AI actually do when it answers — predict or look up?

AI jawab dete waqt asal mein kya karta hai — predict ya look up?

Answer: It predicts the next piece of text. It never looks anything up.

Jawab: Yeh agla text ka tukda predict karta hai. Kabhi kuch look up nahi karta.

Card 2. How did the model learn, and does it keep learning?

Model ne kaise seekha, aur kya woh seekhta rehta hai?

Answer: It learned by reading, once. Then the learning stopped, on purpose.

Jawab: Isne aik baar parh kar seekha. Phir seekhna jaan boojh kar rok diya gaya.

Card 3. Does anything inside the model check whether an answer is true?

Kya model ke andar koi cheez check karti hai ke jawab sach hai?

Answer: Nothing inside it checks whether an answer is true.

Jawab: Iske andar koi cheez yeh check nahi karti ke jawab sach hai ya nahi.

Card 4. In what units does the model read text?

Model text ko kin hisson mein parhta hai?

Answer: It reads in chunks called tokens, not in letters.

Jawab: Yeh 'tokens' naam ke tukdon mein parhta hai, haroof mein nahi.

Card 5. Where is the only place the model can see your situation?

Model aapki soorat-e-haal sirf kahan dekh sakta hai?

Answer: The context window is the only place it can see your situation.

Jawab: Context window hi woh wahid jagah hai jahan woh aapki soorat-e-haal dekh sakta hai.

Card 6. Is the model's confident tone a signal that it is right?

Kya model ka pur-aitmaad lehja sahi hone ki nishani hai?

Answer: No. Its confident tone is a learned style, not a signal of truth.

Jawab: Nahi. Pur-aitmaad lehja seekha hua andaaz hai, sach ki nishani nahi.

Card 7. What does 'uneven ability' (the jagged frontier) mean?

'Uneven ability' (jagged frontier) ka kya matlab hai?

Answer: Its ability is uneven. Brilliant on one task, useless on an easier one.

Jawab: Iski salahiyat barabar nahi. Aik kaam mein kamaal, aur us se aasaan kaam mein nakaam.

Card 8. What do tools add to a model?

Tools model mein kya izafa karte hain?

Answer: Tools let it act in the world, not only describe it.

Jawab: Tools ki madad se yeh duniya mein amal kar sakta hai, sirf bayan nahi.

Card 9. What is the model's 'thinking'?

Model ki 'thinking' kya hai?

Answer: 'Thinking' is more prediction, written before the answer.

Jawab: 'Thinking' bhi prediction hi hai, jo jawab se pehle likhi jati hai.

Course 3: AI Fluency (The 4Ds)

<https://agentfactory.panaversity.org/docs/ai-fluency-crash-course>

Practice Test — 12 MCQs

Q1. A clinic manager opens an assistant and types 'build me a system for following up with patients who miss appointments.' The output looks impressive but nobody can use it. Which competency failed, and why?

Clinic manager likhti hai 'appointment miss karne wale mareezon ke follow-up ka system bana do.' Output shaandaar lagta hai lekin koi use nahi kar sakta. Kaunsi competency fail hui aur kyun?

A) Delegation, because nobody had decided who may be contacted, after how long, in what tone, and which decisions a human must keep

Delegation — kisi ne tay nahi kiya tha kis se, kitni der baad, kis lehje mein rabta ho aur kaunse faislay insaan ke paas rahein

B) Discernment, because she accepted a polished answer without checking any of its factual claims against a reliable source

Discernment — chamakdar jawab bina check kiye maan liya

C) Description, because the request was too short, and a longer, better-worded prompt would have produced a usable answer on the first try

Description — prompt chhota tha, lamba prompt kaam kar jata

D) Diligence, because patient follow-up is regulated work and a consumer AI service was never approved for use with clinical records

Diligence — consumer AI clinical records ke liye approved nahi tha

✓ **Correct answer / Sahi jawab: A**

Explanation: The failure happened before the first prompt. Which patients, how late, what tone, and what needs human approval are clinic policy questions. No amount of prompting decides them for her. Better wording is Description, and it cannot answer a question nobody has settled. Verification is Discernment, and it comes after a goal nobody set.

Wazahat: Nakaami pehle prompt se pehle hui. Kaunse mareez, kitni der, kaunsa lehja, aur kya insaan approve kare — yeh clinic ki policy ke sawal hain; prompting inka faisla nahi karti. Behtar alfaaz Description hai, jo tay na hue sawal ka jawab nahi de sakti.

Q2. The framework defines agency this way. A human configures AI to independently perform future tasks, including for others, on their behalf. Which detail separates agency from automation most sharply?

Framework agency ki tareef yun karta hai: insaan AI ko set karta hai ke woh aainda ke kaam khud-mukhtari se kare, doosron ke liye bhi. Kaunsi baat agency ko automation se sab se wazeh alag karti hai?

- A) Agency needs a more capable model, while automation runs well enough on the smaller and cheaper models most people already have
Agency ko taaqatwar model chahiye
- B) Agency means the AI picks its own goals instead of the goals a person set, which is what makes it so hard to supervise
Agency mein AI apne goals khud chunta hai
- C) Agency always connects the AI to outside tools and live data, while automation only works on text the user pasted into the chat
Agency hamesha bahar ke tools aur live data se judti hai
- D) You are not in the room while the work happens, and the person served may not be you, so judgment is built in beforehand
Kaam ke waqt aap mojud nahi, aur jis ki khidmat ho woh aap nahi bhi ho sakte — is liye faisla pehle se andar rakhna padta hai

✓ **Correct answer / Sahi jawab: D**

Explanation: The words future and for others carry the weight. You set the AI up in advance, and the person meeting it may never be you. Automation and augmentation both keep you in the chair. Agency does not mean AI picks its own goals.

Wazahat: 'Future' aur 'for others' asal alfaaz hain. Aap AI ko pehle se set karte hain, aur us se milne wala shayad aap na hon. Automation aur augmentation mein aap khud baithe hote hain. Agency ka matlab yeh nahi ke AI apne goals chune.

Q3. A team ships an AI tutor. Every individual answer it gives is factually correct, yet students perform worse than before. Which kind of discernment would have caught this, and what does it look at?

Team AI tutor launch karti hai. Har jawab factually sahi hai, phir bhi students pehle se bura perform karte hain. Kaunsi discernment ise pakadti, aur woh kya dekhti hai?

- A) Product discernment, which checks each output for factual errors, missing requirements, internal contradictions, and claims an expert would doubt
Product discernment — har output ki ghaltiyan check karti hai
- B) Process discernment, which asks whether working alongside the AI is still paying off for the team that builds and steers it
Process discernment — kya AI ke saath kaam team ke liye faida mand hai
- C) Performance discernment, which asks whether the AI's independent behavior serves the people meeting it, and shows up only across many cases
Performance discernment — kya AI ka khud-mukhtar rawaiya logon ke kaam aata hai; yeh bohat se cases mein hi nazar aata hai
- D) Creation discernment, which checks that the training data and the connected systems suited the audience the product is aimed at
Creation discernment — training data audience ke mutabiq hai ya nahi

✓ **Correct answer / Sahi jawab: C**

Explanation: Correct answers with worse outcomes points to a behavior problem, not an accuracy problem. The tutor probably gives solutions the moment a student hesitates. That is performance discernment, shown in what users do next. There is no 'creation discernment'; creation belongs to Diligence.

Wazahat: Sahi jawab magar bura nateeja = rawaiye ka masla, accuracy ka nahi. Tutor shayad student ke atakte hi hal de deta hai. Yeh performance discernment hai. 'Creation discernment' koi cheez nahi; creation Diligence ka hissa hai.

Q4. A writer has spent forty minutes steering an assistant through a 600-word article she could have drafted in thirty. The final piece is good. What does the course say she should conclude?

Aik writer ne 600 alfaaz ke article par assistant ko chalane mein chalees minute lagaye, jabke khud tees mein likh leti. Article achha hai. Course ke mutabiq use kya nateeja nikalna chahiye?

A) The process is failing even though the product is fine, and her moves are a new performance description, another tool, or taking it back

Product theek hai magar process nakaam — options: nayi performance description, doosra tool, ya kaam wapas lena

B) The session succeeded, because a good final product is what matters, and the time spent steering is a fair cost of learning any new tool

Session kamyab — achha product hi ahem hai

C) She has a description problem, so the fix is to spend more time up front writing a much fuller brief before the AI drafts anything

Description ka masla — pehle lamba brief likhein

D) She has a delegation problem that can only be solved by splitting the article into smaller pieces and assigning each one to the AI

Delegation ka masla — article ko tukdon mein baantein

✓ **Correct answer / Sahi jawab: A**

Explanation: This is process discernment. Judge the session, not just the last message. Steering that costs more than it saves is a loss counted as a win because it felt productive. The moves escalate: change the performance description, change tools, take the task back.

Wazahat: Yeh process discernment hai — sirf aakhri message nahi, poora session jaanchein. Jo steering bachat se zyada waqt le woh nuqsan hai, chahe productive lage. Qadam: performance description badlein, tool badlein, ya kaam wapas lein.

Q5. You tell an assistant: 'do not agree with me just to be polite, and flag anything you are uncertain about.' The course says this small habit is a scaled-down version of what?

Aap assistant se kehte hain: 'sirf tehzeeb mein meri haan mein haan mat milao, aur jis baat mein shak ho flag karo.' Course ke mutabiq yeh chhoti aadat kis cheez ka chhota roop hai?

A) Product description, since you are specifying the qualities the final output must have before you will accept it as finished work

Product description — final output ki khoobiyan

B) Process description, since you are prescribing the order of the steps the AI should follow while it works through your request

Process description — steps ki tarteeb

C) Context engineering, since you are adding standing information to the conversation that the AI will keep using on all the later turns

Context engineering — standing maloomat

D) Performance description, since you are defining behavior you have not seen yet, and at scale it becomes an agent's standing rules

Performance description — aap aise rawaiye ki tareef kar rahe hain jo abhi hua nahi; bade paimane par yeh agent ke standing rules ban jata hai

✓ **Correct answer / Sahi jawab: D**

Explanation: You are writing a rule for behavior that has not happened yet, for an audience of one. At scale the same kind of sentence governs a thousand strangers. Product is what you want back; process is how the work proceeds.

Wazahat: Aap us rawaiye ka qaida likh rahe hain jo abhi hua nahi, sirf aik shakhs ke liye. Bade paimane par yahi jumla hazaar logon par lagu hota hai. Product = kya wapas chahiye; process = kaam kaise ho.

Q6. An AI recommends Vendor A, and the recommendation is sound. On inspection it turns out the AI believed Vendor A ships a feature that does not exist. What does the course say about this situation?

AI Vendor A recommend karta hai aur recommendation theek hai. Jaanch par pata chalta hai AI samajhta tha ke Vendor A ke paas aik feature hai jo mojud hi nahi. Course kya kehta hai?

- A) The recommendation stands, because discernment judges the usefulness of the output, and the output was the right call
Recommendation qaim — output mufeed tha
- B) This is a hallucination and therefore a Diligence failure, since responsibility for checking vendor claims sits with whoever deploys the decision
Hallucination hai, is liye Diligence ki nakaami
- C) The AI's stated reasoning is a true record of its own internal computation, so a false assumption there proves the conclusion was random
AI ki bayan ki gayi reasoning uske andar ka sachha record hai
- D) A right answer resting on a wrong assumption will not stay right, so judging the result includes judging the case made for it
Ghalat mafrooze par tika sahi jawab sahi nahi rahega — nateeje ke saath uski daleel bhi jaanchni hai

✓ **Correct answer / Sahi jawab: D**

Explanation: A right answer for wrong reasons is still a problem, because the assumption will break on the next decision that depends on it. Ask the AI to list assumptions, evidence, and criteria. What comes back is a justification offered for review, not a record of hidden internal reasoning.

Wazahat: *Ghalat wajah se sahi jawab bhi masla hai — agle faislay par woh mafrooza toot jayega. AI se assumptions, saboot aur criteria likhwayein. Jo milta hai woh review ke liye daleel hai, andar ki chhupi soch ka record nahi.*

Q7. A lecturer pastes student names, grades, and disciplinary notes into a consumer AI service the university never approved. The feedback it drafts is excellent. What does the course conclude?

Aik lecturer students ke naam, grades aur disciplinary notes aik aisi consumer AI service mein paste karta hai jo university ne approve nahi ki. Feedback behtareen hai. Course kya nateeja nikalta hai?

- A) The use is irresponsible whatever the output quality, and the failure is creation diligence: the wrong data went into an unapproved tool
Output jaisa bhi ho, istemal ghair-zimmedarana hai — creation diligence ki nakaami: ghalat data ghair-approved tool mein gaya
- B) The use is acceptable because he reviewed every single comment before sending it, which satisfies deployment diligence and covers the earlier steps
Theek hai kyunke usne har comment review kiya
- C) The failure is transparency diligence, and disclosing the AI's role to the students afterwards would resolve the problem he has created
Transparency diligence ki nakaami — baad mein bata de to theek
- D) The failure is discernment, because he should have judged whether the drafted comments were accurate before allowing them into a student record
Discernment ki nakaami

✓ **Correct answer / Sahi jawab: A**

Explanation: Creation diligence governs what you put in and where. Personal data and disciplinary notes went into an unapproved service. Good output does not repair a bad choice of tool and data.

Wazahat: *Creation diligence tay karti hai kya daala jaye aur kahan. Zaati data aur disciplinary notes ghair-approved service mein gaye. Achha output ghalat tool aur data ke intikhab ko theek nahi karta.*

Q8. The course says AI can automate work but cannot automate accountability. Which situation illustrates that most directly?

Course kehta hai AI kaam automate kar sakta hai, zimmedari nahi. Kaunsi soorat is ki sab se wazeh misaal hai?

- A) A model produces different answers to the same question on different days, so a team cannot reproduce a result they showed a client last week
Model mukhtalif dinon mein mukhtalif jawab deta hai
- B) A coding assistant introduces a security flaw, an engineer ships it, and the engineer and the organization still own the consequences
Coding assistant security flaw daalta hai, engineer ship karta hai — nataij ka zimmedar engineer aur idara hi hai
- C) An assistant refuses a request that falls outside its safety guidelines, so the work must be completed by a person instead
Assistant request se inkaar karta hai
- D) An agent escalates far more cases to humans than anyone expected, which erases most of the time the team hoped the automation would save
Agent umeed se zyada cases insaanon ko bhejta hai

✓ **Correct answer / Sahi jawab: B**

Explanation: The AI wrote the flaw and the humans still carry it. Responsibility does not transfer along with the task.

Wazahat: Flaw AI ne likha lekin bojh insaan uthate hain. Kaam ke saath zimmedari muntaqil nahi hoti.

Q9. Why does the course open by saying a new colleague and an AI assistant are alike in one way and different in another?

Course yeh kyun kehta hai ke naya colleague aur AI assistant aik baat mein aik jaise aur doosri mein mukhtalif hain?

- A) Because AI is faster than a colleague, so the same instructions give results in seconds and there is no need to plan the work in advance
AI tez hai, planning ki zaroorat nahi
- B) Because a colleague can refuse an unreasonable request, and knowing AI will attempt anything is what makes delegation the first competency
Colleague inkaar kar sakta hai, AI sab kuch try karta hai
- C) Because both need context you forgot to give, but AI keeps nothing between chats, so what a person hears once you must supply every time
Dono ko woh context chahiye jo aap dena bhool gaye, magar AI chats ke darmiyan kuch yaad nahi rakhta — jo insaan aik baar sunta hai woh AI ko har baar dena padta hai
- D) Because a colleague improves with feedback over many months, while AI improves inside a single session and then stops improving for good
Colleague mahinon mein behtar hota hai, AI aik session mein

✓ **Correct answer / Sahi jawab: C**

Explanation: The shared problem is missing context. The difference is memory: a colleague still knows next month; every new chat opens with someone who has never met you. Supply context each time or put it where the AI reads it automatically.

Wazahat: Mushtarka masla: context ki kami. Farq: memory — colleague agle mahine bhi jaanta hai; har nayi chat mein AI aap se pehli baar milta hai. Har baar context dein ya aisi jagah rakhein jahan AI khud parhe.

Q10. Ayesha's team tests a reconciliation agent against past reconciliations the firm already trusts. An accountant also reviews some matches that appear to have succeeded, not only the failures. Why review the successes?

Ayesha ki team reconciliation agent ko purani bharosemand reconciliations se test karti hai. Accountant sirf failures nahi, kuch kamyab lagne wale matches bhi review karta hai. Kamyab wale kyun?

- A) To measure how much faster the agent is than the manual process, which is the number the partners want before approving a rollout
Raftaar naapne ke liye
- B) Because a system can look safe when it fails without saying so, and a silent, repeated error hides among the successes that look fine
System chup chaap fail ho kar bhi mehfooz lag sakta hai — khamosh, dohrai jane wali ghalti kamyab lagne walon mein chhupi hoti hai
- C) Because reviewing successes is what satisfies transparency diligence, which requires that clients be shown examples of correct AI-assisted work
Transparency diligence ke liye
- D) Because the agent's accuracy on the cases it got right is the figure that decides whether the escalation threshold sits at the right level
Escalation threshold tay karne ke liye

✓ **Correct answer / Sahi jawab: B**

Explanation: Checking only failures assumes the system announces its failures. A silent failure is a wrong match nobody flags, and from outside it looks exactly like a success. So the sample must include cases that appear fine.

Wazahat: Sirf failures check karna yeh maan lena hai ke system apni nakaami batata hai. Khamosh nakaami aisa ghalat match hai jise koi flag nahi karta, aur bahar se kamyabi jaisa lagta hai. Is liye sample mein theek lagne wale cases bhi hon.

Q11. A reader compares two requests. The first is 'Summarize this report.' The second names the audience, the time they have, the topics to cover, the format, and what to leave out. What is the lesson?

Do requests: pehli 'Is report ka khulasa karo.' Doosri audience, unka waqt, topics, format aur kya chhodna hai sab batati hai. Sabaq kya hai?

- A) The longer request works because length itself signals seriousness, so adding more words to a prompt reliably improves the answer you get
Lambai sanjeedgi dikhati hai, zyada alfaaz behtar jawab
- B) The second one is not more intelligent, it is more complete, and completeness usually matters far more than clever wording does
Doosri zyada zaheen nahi, zyada mukammal hai — mukammal hona chalaak alfaaz se kahin zyada ahem hai
- C) The second one works because it uses the vocabulary of the field, which taps the model's deep knowledge of financial reporting
Doosri field ki istilahaat use karti hai
- D) The pair shows that summarizing is a poor use of AI, and that the reader should have given the reading to a human colleague
Khulasa AI ka ghalat istemal hai

✓ **Correct answer / Sahi jawab: B**

Explanation: The point is completeness, not cleverness or length. The second request supplies audience, constraints, format, and exclusions the first left the AI to guess. Padding without information changes nothing.

Wazahat: Asal baat mukammal hona hai, na chalaaki na lambai. Doosri request woh sab deti hai jo pehli mein AI ko andaaza lagana padta. Bina maloomat ke alfaaz barhane se kuch nahi badalta.

Q12. Where does the course place Diligence in the 10-80-10 Rule, and why does the placement matter?

10-80-10 Rule mein course Diligence ko kahan rakhta hai, aur yeh kyun ahem hai?

- A) In the final 10%, because verifying and vouching for the work is the last gate before anything is published, sent, or acted on
Aakhri 10% mein — publish se pehle aakhri gate
- B) In the first 10%, because the decisions about data, tools, and approvals all have to be settled before any AI is involved at all
Pehle 10% mein — data aur tools ke faislay pehle
- C) Across all 100%, because it surrounds the whole workflow rather than sitting at any one stage, and is never a final checkbox
Poore 100% mein — yeh poore workflow ko gherti hai, kabhi aakhri checkbox nahi
- D) In the middle 80%, because it is exercised continuously while you steer the AI and give feedback on each round of output
Beech ke 80% mein

✓ **Correct answer / Sahi jawab: C**

Explanation: Delegation and Description are strongest at the front. Discernment becomes critical at the end. Diligence runs across the whole thing. Treating it as a final gate is a named beginner mistake.

Wazahat: Delegation aur Description shuru mein, Discernment aakhir mein ahem. Diligence poore kaam par phaili hai. Ise aakhri gate samajhna beginner ki ghalti hai.

Flashcards — 10 cards

Card 1. What four qualities define AI fluency?

AI fluency ki chaar khoobiyan kya hain?

Answer: Effective, efficient, ethical, and safe.

Jawab: Effective (asar-daar), efficient (kam kharch), ethical (akhlaqi), aur safe (mehfooz).

Card 2. What is the difference between automation, augmentation, and agency?

Automation, augmentation aur agency mein kya farq hai?

Answer: Automation runs a defined task, augmentation works with you as a thinking partner, and agency acts toward a goal with more freedom to choose the steps.

Jawab: Automation tay shuda kaam chalata hai; augmentation aapke saath soch ka saathi hai; agency goal ki taraf khud steps chun kar kaam karti hai.

Card 3. What are the three parts of Delegation?

Delegation ke teen hisse?

Answer: Problem awareness, platform awareness, and task delegation.

Jawab: Problem awareness, platform awareness, aur task delegation.

Card 4. What are the three parts of Description?

Description ke teen hisse?

Answer: Product description, process description, and performance description.

Jawab: Product, process aur performance description.

Card 5. Why can a confident AI answer still require verification?

Pur-aitmaad AI jawab ko bhi verify kyun karna padta hai?

Answer: Because sounding right is not the same as being correct. Fluent wording does not verify facts, assumptions, or reasoning.

Jawab: Sahi lagna sahi hona nahi. Rawan alfaaz facts, mafroozon ya daleel ki tasdeeq nahi karte.

Card 6. What are the three parts of Discernment?

Discernment ke teen hisse?

Answer: Product discernment, process discernment, and performance discernment.

Jawab: Product, process aur performance discernment.

Card 7. What are the three parts of Diligence?

Diligence ke teen hisse?

Answer: Creation diligence, transparency diligence, and deployment diligence.

Jawab: Creation, transparency aur deployment diligence.

Card 8. What question can you ask before shipping AI-assisted work?

AI ki madad wala kaam bhejne se pehle kya sawal poochein?

Answer: "Would I confidently put my name on this?"

Jawab: 'Kya main aitmaad se is par apna naam likhunga/likhungi?'

Card 9. In one sentence, what is the 4D loop?

Aik jumle mein 4D loop kya hai?

Answer: Decide what AI should do, describe the work, evaluate what comes back, and take responsibility for the whole process.

Jawab: Tay karein AI kya kare, kaam bayan karein, wapas aane wale ko jaanchein, aur poore amal ki zimmedari lein.

Card 10. How does Discernment become an engineering practice in the Agent Factory?

Agent Factory mein Discernment engineering practice kaise banti hai?

Answer: It becomes evals, monitoring, sampling, and review gates that test whether an AI system performs well enough.

Jawab: Yeh evals, monitoring, sampling aur review gates ban jati hai jo test karte hain ke AI system kaafi achha kaam kar raha hai ya nahi.

Course 4: AI Prompting in 2026

<https://agentfactory.panaversity.org/docs/ai-prompting-2026>

Practice Test — 30 MCQs

Q1. A new analyst types 'which CRM should we buy?' into a frontier model and gets back a generic three-vendor list. A teammate says the answer is generic because the model is weak at enterprise software. Based on Concept 1, what is the actual cause and the fix?

Naya analyst frontier model mein 'kaunsa CRM khareedein?' likhta hai aur aam si teen vendors ki list milti hai. Saathi kehta hai model enterprise software mein kamzor hai. Concept 1 ke mutabiq asal wajah aur hal kya hai?

- A) The model is truly weak at enterprise software tasks, so switching to a model that specializes in business tools would produce a specific pick
Model waqai kamzor hai, business model par jayein
- B) The model lacked web search, and turning search on by itself would make the answer specific to this company's exact situation
Web search nahi tha; search on karne se jawab khaas ho jata
- C) The prompt carried no context, so a power user attaches the team's requirements, budget, and current stack, then asks for the trade-offs
Prompt mein context nahi tha — power user team ki zaroorat, budget aur mojooda stack de kar trade-offs poochta hai
- D) The question was simply too long for the model to parse, so cutting it down to a few sharp keywords would tighten the recommendation
Sawal lamba tha, keywords tak chhota karein

✓ Correct answer / Sahi jawab: C

Explanation: Concept 1 frames AI as a smart new colleague who knows nothing about you yet, so the fix is briefing, not switching models. Web search cannot find the team's internal stack and budget, and keywords remove the very context that helps.

Wazahat: Concept 1: AI aik zaheen naya colleague hai jo aapke baare mein kuch nahi jaanta. Hal briefing hai, model badalna nahi. Team ka andaruni stack aur budget web par nahi milta, aur keywords woh context hi nikal dete hain.

Q2. A manager is annoyed that AI did not factor in 'our standard onboarding process' when drafting a plan, saying a model this advanced should already know it. How does the smart-new-colleague model answer this?

Manager naraz hai ke AI ne plan mein 'hamara standard onboarding process' शामिल nahi kiya; kehta hai itna advanced model ko pata hona chahiye. Smart-new-colleague model kya jawab deta hai?

- A) The model reads whatever you put in front of it but cannot guess what you never told it, so an internal process has to be supplied as context

Model jo saamne rakho parhta hai, jo bataya nahi woh guess nahi kar sakta — andaruni process context mein dena hoga

- B) The manager is right, since a frontier model has read enough of the public internet to infer almost any company's internal onboarding process

Manager sahi hai, model internet se andaaza laga leta

- C) The model could infer the process, but only once the conversation grows long enough for it to pattern-match across many turns

Lambi guftagu ke baad andaaza laga lega

- D) The model would know the process automatically the moment web search is enabled, since it could simply look the company up online

Web search on karte hi pata chal jayega

✓ **Correct answer / Sahi jawab: A**

Explanation: A new hire reads what is in front of them and does not guess what was never said. An internal process is not in training data, won't appear because the chat grows longer, and is not on the public web.

Wazahat: Naya mulazim jo saamne ho parhta hai, ankahi baat guess nahi karta. Andaruni process training data mein nahi, lambi chat se nahi aata, aur public web par bhi nahi.

Q3. Someone asks AI for the rules of an obscure regional folk game and receives three confident, fluent paragraphs. Concept 2 says to do what before trusting them?

Koi AI se aik ghair-marooft ilaqai khel ke qawaid poochta hai aur teen pur-aitmaad paragraph milte hain. Bharosa karne se pehle Concept 2 kya karne ko kehta hai?

- A) Trust the answer, since fluency and confidence reliably indicate the model retrieved a real, well-represented, authoritative source

Bharosa karein, rawani sahi source ki nishani hai

- B) Distrust it, but only because language models are weak at games as an entire category, no matter how common the specific game happens to be

Shak karein kyunke models games mein kamzor hain

- C) Trust it once you ask the model to rate its own confidence, since a model's stated confidence reliably tracks how accurate it actually is

Model se uska confidence poochein

- D) Distrust the confidence: sparse training data means the model likely generalized from similar games, so verify with someone who knows it

Confidence par shak karein — kam data ki wajah se model ne milte julte khelon se andaaza lagaya; jaanne wale se tasdeeq karein

✓ **Correct answer / Sahi jawab: D**

Explanation: Reliability depends on how well-represented a topic is in training data. An obscure game is sparse, so the model blends details from similar games. Confidence and fluency are not the signal, and self-rated confidence does not track accuracy.

Wazahat: Bharosa is par hai ke topic training data mein kitna mojud hai. Ghair-marooft khel ka data kam hai, is liye model milte julte khelon ki baatein mila deta hai. Confidence aur rawani sach ki nishani nahi.

Q4. A user spends time carefully fixing every typo in their prompts and never checks AI claims against other sources. Which pair of corrections does Concept 2 actually recommend?

User prompts ki har typo theek karta hai lekin AI ke daawe kabhi doosre sources se check nahi karta. Concept 2 kaunsi do islahaat batata hai?

- A) Keep fixing typos but stop verifying, since the model is most reliable on exactly the popular, well-covered topics people tend to ask it about
Typos theek karte rahein, verify band
- B) Stop fixing typos (the model handles messy text fine), but do verify important claims, since it absorbed misconceptions from the same text
Typos theek karna chhodein (model bikhra text samajh leta hai), lekin ahem daawe verify karein — usne ghalat fehmiyan bhi seekhi hain
- C) Keep doing both, since fixing typos sharpens the prompt and verifying protects you, and both really change the quality of what comes back
Dono karte rahein
- D) Stop doing both, because once you brief the model well, neither a stray typo nor an unchecked claim has any real effect on the final output
Dono chhod dein

✓ **Correct answer / Sahi jawab: B**

Explanation: AI was trained on typo-filled internet text and handles misspellings fine, so correcting them is wasted effort. The same sources carried confidently-wrong claims, so verifying important claims against a primary source pays off.

Wazahat: AI typo wale internet text par train hua, is liye typos se farq nahi padta. Unhi sources mein pur-aitmaad ghalat daawe bhi the, is liye ahem daawon ko asal source se verify karna faida mand hai.

Q5. A runner asks 'where should I run in Henderson, Nevada?' and AI recommends a school that closed to the public twenty years ago, citing an old web page. Which mode fired, what went wrong, and what is the fix?

Runner poochta hai 'Henderson, Nevada mein kahan daudun?' aur AI aik school batata hai jo bees saal pehle awam ke liye band ho gaya, purane web page ke hawale se. Kaunsa mode chala, kya ghalat hua, hal kya hai?

- A) Web search fired but does not check whether sources are current, so name authoritative, current sources and ask the model to date each claim
Web search chala lekin yeh check nahi karta ke source taaza hai — mustanad, taaza sources ka naam lein aur har daawe ki date maangein
- B) Pretrained mode fired with no search at all, and the only real fix is to manually turn web search on for every single local question you ask
Pretrained mode chala, search on karein
- C) Deep research fired and still failed here, which proves deep research is fundamentally unreliable for any location-based question you ask it
Deep research nakaam hua
- D) The model fabricated the school out of nothing, and the only reliable fix from here is to switch to a completely different model family
Model ne school ghad liya

✓ **Correct answer / Sahi jawab: A**

Explanation: Web search retrieved a real but stale page because the retrieval layer does not check whether a source is current. Name authoritative, current sources and ask the model to date each claim.

Wazahat: Web search ne asli magar purana page uthaya, kyunke retrieval layer taazgi check nahi karti. Hal: mustanad taaza sources batayein aur har daawe ki tareekh maangein.

Q6. A reader notices AI sometimes misrepresents what a web page actually said, even when it clearly searched. Concept 3 explains why and offers a fix. Which is correct?

Reader dekhta hai ke search karne ke bawajood AI kabhi page ki baat ghalat bayan karta hai. Concept 3 wajah aur hal kya batata hai?

- A) The model hallucinated from training data and never actually read the page at all, so the only real fix is to disable web search entirely
Model ne page parha hi nahi, search band karein
- B) The page changed between the moment of the search and the moment of the answer, so re-running the same prompt twice and comparing fixes it
Page beech mein badal gaya
- C) The model cannot read English web pages directly, so you have to paste the relevant page text in yourself every single time you ask
Model English pages nahi parh sakta
- D) A smaller retrieval layer condenses each page before the main model sees it, losing detail, so ask it to quote the exact sentence behind each claim
Aik chhota retrieval layer page ka khulasa bana deta hai aur tafseel gum hoti hai — har daawe ke peeche ka asal jumla quote karwayein

✓ **Correct answer / Sahi jawab: D**

Explanation: A search-and-retrieval layer, often a smaller model, reduces pages to summaries before the main model reads them, which is where nuance is lost. Asking for the exact sentence behind each claim catches summary drift.

Wazahat: Search-retrieval layer (aksar chhota model) pages ko khulase mein badal deta hai, wahin barikiyan gum hoti hain. Har daawe ka asal jumla maangne se yeh farq pakda jata hai.

Q7. You need two things today: the official IRS page for form 1040, and a comparison of three diabetes medications with what recent evidence says. Concept 3's AI-vs-Google rule points you where?

Aaj do cheezein chahiye: form 1040 ka official IRS page, aur teen diabetes dawaon ka recent evidence ke saath muqabla. Concept 3 ka AI-vs-Google rule kahan bhejta hai?

- A) Use AI for both, since AI can do everything Google does and a good deal more, all from one place
Dono ke liye AI
- B) Use Google for both, since each question ultimately resolves to one specific web page you can land on
Dono ke liye Google
- C) Google to land on the known IRS page, and AI to synthesize the multi-source medication comparison
Maloom IRS page ke liye Google, aur kai sources wale dawa muqablay ke liye AI
- D) AI for the IRS page for faster navigation, and Google for the medications since there are more sources to read
IRS ke liye AI, dawaon ke liye Google

✓ **Correct answer / Sahi jawab: C**

Explanation: Reach for Google when you want a link or a specific known site; reach for AI when you want synthesis across sources.

Wazahat: Link ya maloom site chahiye to Google; kai sources ko jod kar nateeja chahiye to AI.

Q8. A user is frustrated that today's chat does not remember a constraint they stated in a separate chat yesterday, and assumes the product is broken. What does Concept 4 say is actually happening?

User pareshan hai ke aaj ki chat ko kal ki alag chat wali shart yaad nahi, aur samajhta hai product kharab hai. Concept 4 kya kehta hai?

A) The model is stateless and answers only from this response's context window, so yesterday's constraint must be re-supplied as a paste or a file

Model ki apni memory nahi; sirf is jawab ki context window se jawab deta hai — kal ki shart paste ya file se dobara dein

B) It is a memory bug in the product, and the right thing to do is report it and wait for the vendor to ship a proper patch for it soon

Memory bug hai, report karein

C) The free tier strips out memory, and upgrading to a paid plan would carry the context across separate chats automatically from then on

Free tier memory hata deta hai, paid lein

D) The model got worse overnight, and simply starting fresh tomorrow morning will restore its memory of the constraint you set

Model raat ko kharab ho gaya

✓ **Correct answer / Sahi jawab: A**

Explanation: The model has no memory of its own and sees only what is in the context window for this response. Memory features store a synthesized profile, not verbatim constraints from one chat, and are not gated behind a paid plan.

Wazahat: Model ki apni yaadasht nahi; sirf is jawab ki context window dekhta hai. Memory features aik khulasa profile rakhte hain, kisi chat ki hoo-ba-hoo shartein nahi, aur yeh paid plan tak mehdood nahi.

Q9. Over one long conversation a user plans a workout, then debugs a spreadsheet, then drafts a thank-you note. The answers get vaguer and start referencing unrelated earlier turns. What is happening and what is the fix?

Aik lambi chat mein user workout plan karta hai, phir spreadsheet debug, phir shukriya note. Jawab mubham hote jate hain aur purani be-ta'alluq baatein aati hain. Kya ho raha hai, hal kya?

A) The model is overloaded right now, and the fix is to ask it one more, very detailed clarifying prompt that pulls its focus back where you want it

Model overload hai, aik aur tafseeli prompt dein

B) Context rot: unrelated earlier topics are crowding the window, so start a new conversation when the topic changes and paste in only what matters

Context rot — purane be-ta'alluq topics window bhar rahe hain; topic badle to nayi chat shuru karein aur sirf zaroori baat paste karein

C) The model needs a larger context window for this, and upgrading to a million-token model would remove the problem entirely going forward

Bari context window chahiye

D) The tool itself is simply broken in this session, and the only reliable fix left is to switch over to a completely different AI product

Tool kharab hai

✓ **Correct answer / Sahi jawab: B**

Explanation: This is context rot. One more clarifying prompt only adds tangled context, and a bigger window does not fix mixed topics. Start a new chat and re-paste only the few facts that matter.

Wazahat: Yeh context rot hai. Aik aur prompt aur uljhan barhata hai, bari window bhi mile jule topics theek nahi karti. Nayi chat kholein aur sirf zaroori facts dein.

Q10. A user keeps pasting the same syllabus, the same audience description, and the same instructions into chat after chat about their kids' school. Concept 4 says this is the signal to do what?

User bachon ke school ke baare mein har chat mein wahi syllabus, audience aur hidayaat paste karta hai. Concept 4 ke mutabiq yeh kis cheez ka ishara hai?

- A) Memorize the standing instructions so that you can at least type them all back in a little faster each time you open a brand-new chat
Hidayaath yaad kar lein
- B) Keep one very long conversation open forever for that topic, so the context never has to be entered again from scratch at any point
Aik lambi chat hamesha khuli rakhein
- C) Switch to a model with a much larger context window, so that the endless repeated pasting at least becomes a bit cheaper to do
Bari context window wala model lein
- D) Set up a project, a workspace with standing files and instructions that every chat inside it inherits, so context is front-loaded just once
Project banayein — workspace jahan files aur hidayaath har chat ko khud milti hain

✓ **Correct answer / Sahi jawab: D**

Explanation: The moment you have pasted the same files or instructions into two or more chats on a topic, that context belongs in a project. A single long chat causes context rot.

Wazahat: Jab aik topic par do ya zyada chats mein wahi files ya hidayaath paste hon, woh context Project mein hona chahiye. Aik lambi chat context rot laati hai.

Q11. A 2023 habit was to append 'think step by step' to hard prompts. Concept 5 says that advice is now mostly obsolete. What replaces it, and what is the implication of the METR trajectory?

2023 mein mushkil prompts ke aakhir mein 'think step by step' likhte the. Concept 5 kehta hai ab yeh purana ho gaya. Iski jagah kya hai, aur METR trajectory ka kya matlab hai?

- A) Invoke reasoning directly with 'think hard', a thinking toggle, or letting the tool decide, and re-test what AI can do every few months
Reasoning seedha chalayein — 'think hard', thinking toggle, ya tool par chhod dein — aur har kuch mahine AI ki salahiyat dobara test karein
- B) Nothing really replaces it, because truly hard prompts are simply beyond what any of the current models can do reliably, even today
Kuch nahi, mushkil kaam models se bahar hain
- C) Keep appending 'think step by step' to hard prompts, because the phrase still measurably improves the quality of modern reasoning models
'Think step by step' likhte rahein
- D) Break every hard task into tiny sub-prompts by hand yourself, because the models still cannot explore multiple approaches internally on their own
Har kaam haath se chhote tukdon mein todein

✓ **Correct answer / Sahi jawab: A**

Explanation: Modern models have built-in reasoning you invoke in plain language or with a toggle, and METR found the longest reliably-completed task climbing fast, from minutes to an hour or more. Hand AI harder tasks and re-test.

Wazahat: Naye models mein reasoning built-in hai jo saada alfaaz ya toggle se chalti hai. METR ke mutabiq AI jitna lamba kaam bharose se kar sakta hai woh minutes se ghante tak barh gaya. Mushkil kaam dein aur dobara test karein.

Q12. A user toggles extended thinking mode on for 'summarize this one paragraph' and 'give me five casual brainstorm ideas.' What does Concept 5 advise?

User 'is aik paragraph ka khulasa' aur 'paanch aam brainstorm ideas' ke liye extended thinking on karta hai. Concept 5 kya mashwara deta hai?

- A) Keep it switched on for absolutely everything, since thinking mode never hurts the result and only ever improves the answer you get back
Har cheez ke liye on rakhein
- B) Turn it off here purely to save money, since the quality of the answer is identical either way on every kind of task you give it
Sirf paisa bachane ke liye band karein
- C) Turn it off for these: thinking mode is slower and spends more budget, so save it for questions you would want a human to take time on
In ke liye band karein — thinking dheemi aur mehngi hai; unhi sawalon ke liye rakhein jin par insaan bhi waqt lagata
- D) Leave it on but just ask for shorter answers, which roughly cancels out the extra cost the thinking would otherwise add to the request
On rakhein magar chhote jawab maangein

✓ **Correct answer / Sahi jawab: C**

Explanation: Quick lookups, short summaries, and casual brainstorming are cases where thinking mode is just slower and costlier. Save it for multi-input, multi-trade-off questions.

Wazahat: Chhoti talaash, chhota khulasa aur aam brainstorm mein thinking mode sirf dheema aur mehnga hai. Ise kai inputs aur trade-offs wale sawalon ke liye rakhein.

Q13. A user writes 'Why is approach A better than approach B?' and the AI dutifully lists reasons A wins. Concept 6 says the problem is in the prompt. What is the neutral rewrite?

User likhta hai 'Approach A, B se behtar kyun hai?' aur AI A ke haq mein wajihen gin deta hai. Concept 6 kehta hai masla prompt mein hai. Neutral rewrite kya hai?

- A) 'Find more evidence that approach A is the better one, so that I can feel really sure about it before I finally commit to it'
'A ke haq mein aur saboot dhoondo'
- B) 'Compare approach A and approach B, and score each on cost, risk, and time, and give the strongest case for and against each'
'A aur B ka muqabla karo, har aik ko cost, risk aur waqt par score do, aur har aik ke haq aur khilaf sab se mazboot daleel do'
- C) 'Confirm for me that approach A is the better one here, and then go on to tell me exactly how confident you are in that'
'Confirm karo ke A behtar hai'
- D) 'Tell me one more time why approach A is better, but in much more detail this time and with several concrete worked examples'
'Dobara batao A kyun behtar hai'

✓ **Correct answer / Sahi jawab: B**

Explanation: Verbs like find, defend, confirm, and prove hand the AI a conclusion before the question starts. The neutral rewrite lays out both options without a preference and asks for scored pros and cons.

Wazahat: Find, defend, confirm, prove jaise alfaaz sawal se pehle hi nateeja de dete hain. Neutral sawal dono options barabar rakhta hai aur score ke saath fawaid-nuqsanat maangta hai.

Q14. A founder asks 'I have a great business idea, critique it' and gets warm praise. They re-ask with a five-point rubric scored 1 to 10, and the same model rates the idea harshly with concrete reasons. Why does forcing a number work?

Founder kehta hai 'mera business idea zabardast hai, tanqeed karo' aur tareef milti hai. Phir 1-10 wala paanch nukaati rubric deta hai to wahi model sakht score aur wajahen deta hai. Number maangna kyun kaam karta hai?

- A) The number simply flatters the model into trying a bit harder, which is itself a well-known and recognized form of prompt engineering
Number model ko khush karta hai
- B) The number makes the model switch over into a more capable internal mode that it normally keeps in reserve only for graded, scored tasks
Number chhupa hua taaqatwar mode chalata hai
- C) The rubric replaces the model's own judgment with arithmetic, so the resulting score is purely mechanical and not about the idea
Rubric faislay ki jagah hisaab rakh deta hai
- D) Vague praise is cheap, but a specific score forces the model to commit and look harder, and gives you something you can act on and track
Mubham tareef sasti hai; khaas score model ko faisla karne aur ghaur se dekhne par majboor karta hai, aur aapko track karne layak cheez deta hai

✓ **Correct answer / Sahi jawab: D**

Explanation: A model wanting to please can call a draft 'strong' without committing, but choosing between a 6 and a 7 makes it look. The number also tells you what to fix first and whether the next draft improved.

Wazahat: *Khush karne wala model bina faisla kiye 'strong' keh deta hai, magar 6 aur 7 mein chunna use asal mein dekhne par majboor karta hai. Number yeh bhi batata hai pehle kya theek karna hai aur agla draft behtar hua ya nahi.*

Q15. Asked for 'ways to exercise at home,' AI returns squats, push-ups, and planks: not wrong, just average. Concept 7 says the way past average is not a cleverer single prompt. What is it?

'Ghar par exercise ke tareeqe' poochne par AI squats, push-ups, planks deta hai — ghalat nahi, bas aam. Concept 7 ke mutabiq aam se aage jaane ka tareeqa kya hai?

- A) A loop: load context up front, demand three to five options, give explicit feedback, demand new options, iterate, then expand the best one
Loop: pehle context, 3-5 options maangein, saaf feedback dein, naye options maangein, dohraayein, phir behtareen ko phailayein
- B) A single longer, more detailed one-shot prompt that carefully anticipates everything you could possibly need from it right up front
Aik lamba tafseeli prompt
- C) A bigger and more capable model, on the theory that it is really the smaller models that keep defaulting to the most common answers
Bara model
- D) Turning on web search for the request, so that the model can go and dig up the less common, more unusual exercises from around the web
Web search on karein

✓ **Correct answer / Sahi jawab: A**

Explanation: The average internet answer is common, so the average AI answer is common. The way around it is the brainstorm-iterate loop; forcing alternatives and explicit feedback pushes past the first instinct.

Wazahat: *Internet ka aam jawab aam hai, is liye AI ka pehla jawab bhi aam hota hai. Brainstorm-iterate loop — mutabadil options aur saaf feedback — pehli soch se aage le jata hai.*

Q16. A writer is tempted to ask AI for a finished 600-word draft on the first try. Concept 7 says to outline first. What is the underlying reason outlining beats drafting first?

Writer pehli koshish mein mukammal 600 alfaaz ka draft maangna chahti hai. Concept 7 kehta hai pehle outline. Outline behtar kyun hai?

- A) Outlines are simply shorter than drafts, so the model ends up spending noticeably less of its usage budget when it produces one first
Outline chhoti hai, budget bachta hai
- B) Outlines are an easier task for the model to handle than full prose is, so the quality of what it produces comes out measurably higher
Outline model ke liye aasaan hai
- C) Power in writing is structural: a word changed in an outline can redirect the whole piece, and AI writes word-by-word, so force structure first
Likhai ki taaqat dhaanche mein hai — outline ka aik lafz poora mazmoon mod sakta hai, aur AI lafz-ba-lafz likhta hai, is liye pehle dhaancha
- D) Drafting first is perfectly fine as long as you carefully grade the finished draft afterward, and the outline step is really just optional polish
Pehle draft theek hai, outline sirf izafi polish

✓ **Correct answer / Sahi jawab: C**

Explanation: Editing one word in an outline can change the whole direction; editing one word in a draft changes one word. AI generates word-by-word, so it cannot see the shape unless you force structure first.

Wazahat: Outline mein aik lafz badalne se poori simt badal sakti hai; draft mein sirf aik lafz. AI lafz-ba-lafz banata hai, is liye dhaancha pehle na ho to poori shakal nahi dekhta.

Q17. A teacher photographs a whiteboard where his head blocks one word in a diagram, and AI infers the missing word correctly. But when he asks 'which gym machines are these?' from a slightly blurry photo, AI answers confidently and wrong. What principle does this illustrate?

Teacher whiteboard ki photo leta hai jahan uska sar aik lafz chhupa deta hai, aur AI sahi andaaza lagata hai. Lekin thodi dhundli photo mein 'yeh kaunsi gym machines hain?' par AI pur-aitmaad ghalat jawab deta hai. Kaunsa usool hai?

- A) The camera quality alone decides the whole outcome here, so a noticeably sharper, steadier photo would have made both of the tasks succeed
Sirf camera quality faisla karti hai
- B) AI is simply unreliable with any image at all, so it should not really be trusted or used for visual tasks of any kind
AI kisi image par bharosemand nahi
- C) The whiteboard only worked because text is easy for it, and AI cannot interpret diagrams or full real-world scenes at all yet
Sirf text aasaan hai, diagrams nahi
- D) AI reads images coarsely: strong on gist, scene, and inference, weak on fine detail, so trust the gist and verify fine detail for high stakes
AI tasveer ko mota mota parhta hai — khulasa, manzar aur andaaze mein mazboot, bareek tafseel mein kamzor; ahem cheezon mein tafseel verify karein

✓ **Correct answer / Sahi jawab: D**

Explanation: AI is strong on overall scene and inferring from the gist, and weak on fine details and small or similar-looking objects. Trust the gist and double-check fine detail for high stakes.

Wazahat: AI poore manzar aur khulase se andaaza lagane mein mazboot, bareek tafseel aur milti julti cheezon mein kamzor hai. Khulase par bharosa, tafseel ko dobara check karein.

Q18. Concept 8's diagram recipe structures a diagram as SVG in Claude, then redraws it for polish in ChatGPT or Gemini. Which statement captures both why the order is what it is and what survives when the leading tools change?

Concept 8 ki diagram recipe: Claude mein SVG ke taur par dhaancha, phir ChatGPT/Gemini mein polish. Kaunsa bayan tarteeb ki wajah aur tools badalne par kya bachta hai dono batata hai?

A) The order is basically arbitrary, since any tool can do either of the two steps about equally well, so just pick whichever you have open

Tarteeb be-maani hai

B) Structure first in the strongest reasoning model, then polish in the strongest text-heavy image model, and the two-step chain outlasts the named leaders

Pehle sab se mazboot reasoning model mein dhaancha, phir text-heavy image model mein polish — yeh do qadam wala tareeqa naam badalne ke baad bhi rehta hai

C) Always do both of the steps inside one single tool, so that you never lose any labels in the handoff between two different models

Dono aik hi tool mein

D) Polish the image first and structure it second, on the theory that a beautiful finished draft is much easier to reason carefully about

Pehle polish phir dhaancha

✓ **Correct answer / Sahi jawab: B**

Explanation: Deciding what belongs in a diagram is a reasoning task; rendering text-heavy images well is a different strength. Named leaders will rotate; structure first, then polish survives.

Wazahat: Diagram mein kya ho yeh reasoning ka kaam hai; text wali tasveer achhi banana alag khoobi. Naam wale leaders badlenge, magar 'pehle dhaancha, phir polish' qaim rahega.

Q19. After a single prompt, AI renders a working Pomodoro timer in a side panel of the chat. A user assumes it is just a screenshot preview. What is actually true about that object, per Concept 9?

Aik prompt ke baad AI chat ke side panel mein chalta hua Pomodoro timer bana deta hai. User samajhta hai yeh sirf screenshot hai. Concept 9 ke mutabiq sach kya hai?

A) It is an artifact (Artifacts in Claude, Canvas in ChatGPT and Gemini): a persistent object you can edit in place, iterate on, and share by link

Yeh artifact hai (Claude mein Artifacts, ChatGPT/Gemini mein Canvas) — qaim rehne wali cheez jise wahin edit, behtar aur link se share kar sakte hain

B) It is only a static preview of the result, so to change anything at all about it you have to regenerate the entire app again from scratch

Sirf static preview

C) It only runs for as long as that one chat tab stays open, and it disappears permanently the very moment that you close the tab on it

Tab band hote hi khatam

D) Anyone you try to share it with first has to have their own paid account before they are even able to open and use the thing at all

Share karne ke liye paid account chahiye

✓ **Correct answer / Sahi jawab: A**

Explanation: The panel holds an artifact: persistent, iterable in place ('make the button bigger' edits it), and shareable via a public link recipients can open without an account.

Wazahat: Panel mein artifact hai: qaim rehta hai, wahin badla ja sakta hai ('button bara karo' se edit hota hai), aur public link se share hota hai jo bina account khulta hai.

Q20. Using the Goal / Input / Output recipe, which request is realistic for a one-prompt build, and which needs real engineering beyond a single prompt?

Goal / Input / Output recipe ke saath kaunsi request aik prompt mein ban sakti hai aur kaunsi ko asal engineering chahiye?

- A) A real-time multiplayer game with accounts and matchmaking is a perfectly fine one-prompt build, while a single-screen bill splitter is too trivial
Multiplayer game aik prompt mein, bill splitter bohat maamooli
- B) Both of these are realistic one-prompt builds today, and nothing much in this whole space still needs more than a single prompt anymore
Dono aik prompt mein
- C) A single-screen bill splitter with no accounts and no services is a realistic one-prompt build, while internet multiplayer needs real engineering
Aik screen ka bill splitter (bina accounts/services) aik prompt mein; internet multiplayer ko asal engineering chahiye
- D) Neither one is actually possible from just a prompt, because all real app building of any kind still requires you to sit down and write the code yourself
Dono namumkin

✓ **Correct answer / Sahi jawab: C**

Explanation: Small things that fit on one screen with no accounts and no external services work; networking, accounts, and matchmaking are still beyond a one-prompt build.

Wazahat: *Aik screen wali, bina accounts aur bahar ki services wali cheezein ban jati hain; networking, accounts aur matchmaking abhi aik prompt se bahar hain.*

Q21. You paste eighteen numbers and ask for the median, average, and outliers. The reply is a confident paragraph of numbers with no visible code block. Concept 10 says what happened, and what should you do?

Aap atharah numbers paste karke median, average aur outliers poochte hain. Jawab pur-aitmaad paragraph hai, koi code block nahi. Concept 10 kya kehta hai?

- A) The numbers are guaranteed to be correct, because models compute deterministically, so you can simply read them off and accept them as final
Numbers yaqeenan sahi hain
- B) The model cannot do arithmetic at all on its own, so the only safe fix here is to sit down and compute the whole thing yourself
Model hisaab kar hi nahi sakta, khud karein
- C) The model needs a larger context window to handle all eighteen numbers at once, and upgrading the plan would clear the problem up
Bari context window chahiye
- D) The model answered from a glance without running code, the silent failure, so ask it to write and run code and show it, and check a count first
Model ne bina code chalaye nazar daal kar jawab diya (khamosh nakaami) — code likh kar chalane aur dikhane ko kahein, aur pehle count check karein

✓ **Correct answer / Sahi jawab: D**

Explanation: The model chooses whether to run code based on phrasing, and on small questions it may answer from a glance, which looks identical to real analysis. Ask explicitly for code and demand a verifiable specific up front.

Wazahat: *Model alfaaz dekh kar tay karta hai code chalana hai ya nahi; chhote sawal par nazar se jawab de deta hai jo asal analysis jaisa lagta hai. Saaf code maangein aur koi check hone wali cheez (jaise count) pehle maangein.*

Q22. An AI did run code on your uploaded spreadsheet and produced charts. Concept 10 says reliability is high but not infinite. Which three things still deserve a manual check?

AI ne spreadsheet par code chala kar charts banaye. Concept 10 kehta hai bharosa zyada hai magar la-mehdood nahi. Kaunsi teen cheezein phir bhi khud check karein?

- A) The font of the chart it drew, the exact color palette that it happened to choose, and the file name it saved the final output under
Font, rang, file ka naam
- B) The final totals (it may have summed the wrong column), the graph labels (sometimes confidently wrong), and any column it may have misread
Totals (ghalat column jod sakta hai), graph labels (kabhi pur-aitmaad ghalat), aur ghalat parha gaya column
- C) Only the spelling in the summary text it wrote, since the underlying math itself is always reliably right the moment any code has run
Sirf spelling
- D) Nothing at all really needs checking here, because once actual code has run on the file, every single part of the output is effectively verified
Kuch nahi

✓ **Correct answer / Sahi jawab: B**

Explanation: Even when code ran, check totals (wrong column), graph labels (captions sometimes confidently wrong), and column reading (a misread column makes everything unsound).

Wazahat: Code chalne ke baad bhi: totals (ghalat column), graph labels (kabhi ghalat), aur column ki parhai (ghalat column poora analysis bigaad deta hai) check karein.

Q23. You want an AI desktop app like Cowork to reorganize a messy client folder. Concept 11 prescribes a specific safe workflow. What is it?

Aap Cowork jaisi AI desktop app se bikhra client folder theek karwana chahte hain. Concept 11 kaunsa mehfooz tareeqa batata hai?

- A) Tell it the task, ask for a plan rather than action, review and edit the proposed file operations, and only then approve the execution
Kaam batayein, amal ki jagah plan maangein, file operations review/edit karein, phir hi approve karein
- B) Grant it full disk access right away so it has absolutely everything it could need, and then simply let it reorganize the whole folder freely
Foran full disk access dein
- C) Let it act on the messy folder immediately, and then just undo anything at all that you happen to dislike afterward from the recycle bin
Foran karne dein, baad mein recycle bin se wapas
- D) Ask it to go ahead and reorganize the folder, and then have it email you a full report of everything that it changed after the fact
Karne dein, phir report email karwayein

✓ **Correct answer / Sahi jawab: A**

Explanation: State the task, ask for a plan, review the proposed file operations, then approve. AI-deleted files often skip the recycle bin and edits overwrite with no history.

Wazahat: Kaam batayein, plan maangein, file operations dekhein, phir approve karein. AI ki delete ki hui files aksar recycle bin mein nahi jatin aur edits bina history overwrite hote hain.

Q24. A user is deciding how much file access to give a new AI desktop app. Concept 11 gives two facts and a principle. Which option states them correctly?

User soch raha hai nayi AI desktop app ko kitna file access de. Concept 11 do facts aur aik usool deta hai. Kaunsa option sahi hai?

- A) AI-deleted files always land safely in the recycle bin and edits always keep their history, so broad access on day one carries little risk
Deleted files hamesha recycle bin mein, history hamesha rehti hai
- B) The right permission scope is simply whatever happens to match how reputable and well-known the company that built the tool currently is
Ijazat company ki shohrat ke mutabiq
- C) AI-deleted files often do NOT reach the recycle bin and edits overwrite with no history, so scope tightly and grow scope with track record
AI ki deleted files aksar recycle bin tak NAHI pahunchtin aur edits bina history overwrite hote hain — tang daira rakhein aur record ke saath barhayein
- D) Once an app has worked correctly even one single time for you, it has effectively earned full disk access from that point onward
Aik baar kaam kar gaya to full access

✓ **Correct answer / Sahi jawab: C**

Explanation: Deletions often bypass the recycle bin and edits overwrite without history unless you use version control. Scope should grow with track record in your workflow, not vendor reputation or a single success.

Wazahat: *Deletions aksar recycle bin se bach jati hain aur edits bina history overwrite hote hain (version control ke baghair). Ijazat aapke kaam mein track record ke saath barhe, na ke company ki shohrat ya aik kamyabi se.*

Q25. A worker uses one AI tool for every task and is loyal to it because it topped a leaderboard once. Concept 12 pushes back. What is the reasoning?

Aik worker har kaam ke liye aik hi AI tool use karta hai kyunke woh aik baar leaderboard par top tha. Concept 12 kyun ikhtilaf karta hai?

- A) They are basically right, because once a model tops a public leaderboard it tends to stay the single best one for the foreseeable future
Woh sahi hai
- B) AI is jagged (different models lead different tasks) and the leader rotates every few months, so keep a few tabs open and re-check Arena
AI jagged hai (mukhtalif models mukhtalif kaamon mein aage) aur leader har kuch mahine badalta hai — kuch tabs khule rakhein aur Arena dobara dekhein
- C) They should instead just go and pick whichever single model happens to be cheapest right now, and then use only that one for everything
Sab se sasta model lein
- D) They should pick whichever model is strongest at writing prose and then use that same one for everything, including images and code too
Likhai mein behtareen model sab ke liye

✓ **Correct answer / Sahi jawab: B**

Explanation: There is no single best model: AI is jagged and the leader changes every few months. Try the same prompt in two or three tools and check Arena monthly.

Wazahat: *Koi aik behtareen model nahi: AI jagged hai aur leader badalta rehta hai. Aik prompt do-teen tools mein try karein aur har mahine Arena dekhein.*

Q26. Concept 12 says you can iterate on text fifty times in an afternoon but cannot do that with video. What does this cost-and-speed difference imply for how you prompt?

Concept 12 kehta hai text par aik dopahar mein pachaas baar iterate kar sakte hain, video par nahi. Is cost aur raftaar ke farq ka prompting par kya asar hai?

- A) Avoid images and video entirely from now on, since only text is really worth using for any kind of serious, careful work
Images aur video chhod dein
- B) Iterate on video exactly as freely as you already do on text, since the cost difference between them is far too small to change behavior
Video par bhi text jitna iterate karein
- C) Always generate the expensive video first to lock that part in, and then go back and fill in all of the surrounding text afterward
Pehle mehngi video banayein
- D) Each image or video round is slow and costly, and images have no early-stop, so front-load the prompt, even using a text AI to write it
Har image/video round dheema aur mehnga hai, images mein beech mein rukna nahi — prompt pehle se mukammal karein, chahe text AI se likhwayein

✓ **Correct answer / Sahi jawab: D**

Explanation: Cheap, fast text invites heavy iteration; images (cents, no early-stop) and video (minutes and dollars per round) reward front-loading the prompt, including using a text AI to write it.

Wazahat: Sasta tez text zyada iteration ki dawat deta hai; images aur video mehngi aur dheemi hain, is liye prompt pehle hi mukammal karein, text AI se likhwa kar bhi.

Q27. For a high-stakes memo, a user runs two Claude models against each other and calls it cross-model verification. Concept 13 says this misses the point. Why, and what is the correct setup?

Ahem memo ke liye user do Claude models ko aapas mein check karwata hai aur ise cross-model verification kehta hai. Concept 13 kyun kehta hai yeh ghalat hai, sahi tareeqa kya?

- A) Same-family models share habits and blind spots, so it is not real cross-checking. Draw from different families and treat the score as progress
Aik khandan ke models ki aadatein aur andhe dhabbe milte hain — asal cross-check nahi. Mukhtalif khandanon ke models lein aur score ko taraqqi ka ishara samjhein
- B) Two models is simply far too few to rely on, and you really must always use at least four of them before any answer can be properly trusted
Kam az kam chaar models chahiye
- C) It is already correct exactly as it stands, because any two models that check each other is plenty, no matter which family they each come from
Bilkul sahi hai
- D) Cross-model checking is fairly pointless anyway, because all of the major models end up sharing essentially all of the same training data
Cross-model checking bekaar hai

✓ **Correct answer / Sahi jawab: A**

Explanation: Two Claude models cross-checking is not real cross-model checking; value comes from different families catching each other's blind spots. The result is a progress signal; humans still verify load-bearing facts.

Wazahat: Do Claude models ki jaanch asal cross-model nahi; faida mukhtalif khandanon se aata hai. Nateeja taraqqi ka ishara hai; ahem facts insaan hi verify kare.

Q28. A reader objects: 'Concept 6 warned that a model grading its own work tends toward sycophancy, but Concept 13 tells me to make a model grade its own draft. Which is it?' How does Concept 13 resolve this?

Reader kehta hai: 'Concept 6 ne kaha model apna kaam grade kare to khushamad karta hai, magar Concept 13 kehta hai model apna draft grade kare. Kaun sahi?' Concept 13 kaise hal karta hai?

- A) The two concepts flatly contradict one another, so one of the two of them must therefore simply be wrong and ought to be ignored here
Dono mein tazaad hai
- B) Self-grading is always perfectly safe to do, and Concept 6's warning was only ever meant to apply when you grade other people's drafts
Self-grading hamesha mehfooz
- C) The difference is the rubric: 'is this good?' returns praise, but named criteria scored 1 to 10 force the model to name what is missing
Farq rubric ka hai — 'kya yeh achha hai?' tareef laata hai, magar 1-10 scored naamzad criteria model ko kami batane par majboor karte hain
- D) You should never self-grade your own work at all, because only real multi-model checking can ever produce a real, honest quality signal
Kabhi self-grade na karein

✓ **Correct answer / Sahi jawab: C**

Explanation: Without a rubric, self-grading collapses into 'great work'. Named, scored criteria force the model to name what is missing, turning self-critique into a forcing function.

Wazahat: *Rubric ke baghair self-grading 'zabardast kaam' ban jati hai. Naamzad, scored criteria model ko kami batane par majboor karte hain.*

Q29. The page claims almost every technique on it is one of two moves in disguise. A reader wants the single sentence to remember if they forget everything else. Which is it?

Page kehta hai taqreeban har technique do moves mein se aik hai. Agar sab bhool jayein to kaunsa aik jumla yaad rakhein?

- A) Write noticeably longer prompts whenever the answer comes back shallow, and shorter prompts whenever it comes back far too verbose for you
Satahi jawab par lamba prompt, lambe par chhota
- B) Get the right context in and keep the wrong context out: attaching a file gets context in, and a fresh chat keeps the wrong context out
Sahi context andar laayein aur ghalat bahar rakhein — file lagana context andar laata hai, nayi chat ghalat context bahar rakhti hai
- C) Always reach straight for the single most capable model available and turn thinking mode on for absolutely every question that you ask it
Hamesha sab se taaqatwar model aur thinking on
- D) Trust the model's confidence as a guide, on the reasoning that a fluent, well-written, professional-sounding answer is usually a correct one
Model ke confidence par bharosa

✓ **Correct answer / Sahi jawab: B**

Explanation: One move underneath everything: get the right context in, keep the wrong context out. Briefing with files gets context in; a new chat when the topic changes keeps wrong context out.

Wazahat: *Sab ke neeche aik hi move: sahi context andar, ghalat bahar. Files se briefing = context andar; topic badle to nayi chat = ghalat context bahar.*

Q30. A manager dismisses AI as the 'clever toy' they tried in 2022 and refuses to hand it anything hard. Based on the 'what changed' section and Concept 5, what is the corrective?

Manager AI ko 2022 wala 'chalaak khilona' keh kar mushkil kaam nahi deta. 'What changed' section aur Concept 5 ke mutabiq islah kya hai?

A) The manager is basically right, and nothing fundamental has actually changed about AI since 2022, only the marketing and the hype around it

Manager sahi hai

B) Only the user interface really changed since then, and the underlying capability of the models is essentially identical to what it was in 2022

Sirf interface badla

C) The right response is to just wait a few more years, until the tools finally settle down and stabilize, before trying them again

Kuch saal intezaar karein

D) Context windows grew about a thousandfold, real reasoning and built-in search and code arrived, and the reliable-task length jumped to an hour

Context windows taqreeban hazaar guna barhin, asal reasoning, built-in search aur code aaye, aur bharosemand kaam ki lambai ghante tak pahunch gayi

✓ **Correct answer / Sahi jawab: D**

Explanation: Real shifts: context windows up about a thousandfold, real reasoning, built-in search and code execution, multimodal, desktop apps; METR shows reliable-task length climbing fast. Re-test your assumptions.

Wazahat: Asal tabdeeliyan: context window ~1000 guna, asal reasoning, search aur code, multimodal, desktop apps; METR ke mutabiq kaam ki lambai tezi se barh rahi hai. Apne mafroozay dobara test karein.

Course 5: Claude & ChatGPT 101

<https://agentfactory.panaversity.org/docs/claude-chatgpt-101-crash-course>

Practice Test — 12 MCQs

Q1. A consultant has used ChatGPT daily for a year and refuses to open Claude, on the grounds that switching would mean learning a whole second product. What does the course say is wrong with that reasoning?

Aik consultant saal bhar se roz ChatGPT use karta hai aur Claude kholne se inkaar karta hai ke poora doosra product seekhna padega. Course ke mutabiq is soch mein kya ghalat hai?

A) Most of what he learned is actually the discipline, and it transfers; the new part is only where a second product keeps its switches

Usne jo seekha woh zyada tar discipline hai jo muntaqil hota hai; naya sirf yeh hai ke doosre product mein switches kahan hain

B) Claude is the stronger product for consulting work, so the year he spent in the other tool was mostly wasted effort he could have avoided

Claude behtar hai, saal zaaya hua

C) Running one task in two assistants is the only reliable way to detect a hallucination, since two models rarely invent the same wrong fact

Do assistants hi hallucination pakadne ka wahid tareeqa

D) Vendors change their interfaces so often that loyalty to any single product is guaranteed to leave him stranded within a year or two

Interface badalte rehte hain, wafadari nuqsan deh

✓ **Correct answer / Sahi jawab: A**

Explanation: The transferable part is describing, delegating, checking, and knowing when to escalate. Only the switch layout is product-specific — two cockpits, one discipline.

Wazahat: Muntaqil hone wala hissa: bayan karna, delegate karna, check karna, aur kab escalate karna. Sirf switches ki jagah product ke mutabiq hai — do cockpit, aik discipline.

Q2. An analyst always leaves the assistant on its fastest setting, and complains that it keeps making arithmetic slips in a multi-step margin calculation. What is the course's diagnosis?

Analyst assistant ko hamesha sab se tez setting par rakhta hai aur shikayat karta hai ke kai qadam wale margin hisaab mein ghaltiyan hoti hain. Course ki tashkhees kya hai?

A) Arithmetic is the one job that no tier handles reliably, so the calculation should be moved to a spreadsheet and out of the assistant entirely

Hisaab koi tier nahi kar sakta, spreadsheet use karein

B) He picked the tier by habit rather than by task, and multi-step reasoning is exactly the kind of work the thinking tier exists to absorb

Usne tier aadat se chuna, kaam ke mutabiq nahi — kai qadam wali reasoning hi thinking tier ka kaam hai

C) The model names on his account changed in a recent release, so the setting he believes is fast is now pointing at something different

Model ke naam badal gaye

D) His context is too thin, and attaching the underlying figures as a file would let the fast tier complete the same work without slipping

Context kam hai, figures file mein lagayein

✓ **Correct answer / Sahi jawab: B**

Explanation: Sometimes 'the AI failed' really means 'I used the wrong level of capability.' Several steps of dependent logic is the textbook trigger to escalate.

Wazahat: Kabhi 'AI fail hua' ka matlab hota hai 'maine ghalat level use kiya'. Aik doosre par munhasir kai qadam wali logic escalate karne ka wazeh ishara hai.

Q3. Two colleagues send the same eight words, 'Summarize this contract and flag unusual terms.' One gets a useful answer and one gets a vague one. The prompts are identical. What most likely explains the gap?

Do saathi aik jaise aath alfaaz bhejte hain: 'Is contract ka khulasa karo aur ghair-maamooli shartein flag karo.' Aik ko mufeed jawab, doosre ko mubham. Farq ki sab se mumkin wajah?

- A) The useful answer came from the thinking tier, because flagging unusual terms is comparison work rather than routine summarizing work
Mufeed jawab thinking tier se aaya
- B) One of them had standing instructions saved that told the assistant to lead with the answer and to write for a business audience
Aik ke paas standing instructions thin
- C) One of them attached the contract, so the assistant could read the document instead of guessing what such a contract usually says
Aik ne contract attach kiya, to assistant ne document parha, andaaza nahi lagaya
- D) The vague answer came from a chat that had run long enough that earlier context had been pushed out of the conversation window
Mubham jawab lambi chat se aaya

✓ **Correct answer / Sahi jawab: C**

Explanation: Identical words, different context. A model can only work with the information in front of it, and a contract nobody attached is not in front of it.

Wazahat: Alfaaz aik jaise, context mukhtalif. Model sirf saamne ki maloomat se kaam karta hai; jo contract attach nahi hua woh saamne hi nahi.

Q4. A freelancer asks whether she should create a project for a one-hour job she will never repeat: rewriting a single bio for a conference program. What does the course's test say?

Freelancer poochti hai ke kya aik ghante ke aise kaam ke liye project banaye jo kabhi dobara nahi hoga — conference ke liye aik bio dobara likhna. Course ka test kya kehta hai?

- A) Yes, because a project is the only place where uploaded files stay available across more than one conversation with the assistant
Haan, project hi files ko kai chats mein rakhta hai
- B) Yes, because starting a project now costs nothing and gives her somewhere to keep the work if the client ever comes back with more
Haan, muft hai aur baad mein kaam aa sakta hai
- C) No, because projects are a paid-plan feature and a single short rewrite is not enough work to justify upgrading an account for it
Nahi, projects paid feature hain
- D) No, because the test is repetition, and she has not explained that background or uploaded the very same file three separate times
Nahi — test repetition hai; usne wahi background ya file teen baar nahi di

✓ **Correct answer / Sahi jawab: D**

Explanation: If you have explained the same context or uploaded the same file three times, that work deserves a room of its own. One-off questions do not. Free accounts can create projects.

Wazahat: Agar wahi context teen baar samjhaya ya wahi file teen baar upload ki, to us kaam ko apna kamra (project) chahiye. Aik baar ke kaam ko nahi. Free accounts bhi project bana sakte hain.

Q5. A researcher keeps two clients in two projects and is worried that details from one will surface in the other's work. Which product behavior addresses that specific worry?

Researcher do clients ko do projects mein rakhta hai aur darta hai ke aik ki tafseel doosre ke kaam mein aa jayegi. Kaunsa product feature is khaas fikr ka hal hai?

A) ChatGPT's project-only memory, which walls off the project so that memories from outside it are not referenced in any of its chats

ChatGPT ki project-only memory — project ke gird deewar, bahar ki memories iski chats mein nahi aatin

B) Claude's retrieval mode, which searches project knowledge rather than loading all of it once the material grows past the context window

Claude ka retrieval mode

C) Standing instructions, which can be written to tell the assistant never to mention one client while it is working on the other client

Standing instructions

D) An incognito or temporary chat, which keeps the conversation out of history so nothing from it can reach the other project later

Incognito chat

✓ **Correct answer / Sahi jawab: A**

Explanation: Project-only memory turns a project from an organizing convenience into a boundary. Retrieval is about capacity; an instruction is a request, not a wall; incognito does not scope existing memories.

Wazahat: Project-only memory project ko sirf tarteef se barh kar aik had bana deti hai. Retrieval gunjaish ka maamla hai; instruction sirf darkhwast hai, deewar nahi; incognito mojudaa memories ko mehdood nahi karta.

Q6. A manager writes 'I am currently negotiating the Henderson renewal' into his custom instructions, and three months later the assistant is still bringing up a deal that closed long ago. Which mistake does the course name?

Manager custom instructions mein likhta hai 'main Henderson renewal par baat cheet kar raha hoon', aur teen mahine baad bhi assistant band ho chuki deal ka zikr karta hai. Course kaunsi ghalti batata hai?

A) He should have used an incognito chat, because commercially sensitive negotiations do not belong in any stored context at all

Incognito use karni chahiye thi

B) He put evolving context where stable rules belong: a live negotiation is what memory is for, and instructions are for what stays true

Usne badalta hua context mustaqil qawaid ki jagah rakh diya — jaari negotiation memory ka kaam hai; instructions us ke liye jo sach rehta hai

C) He should have created a project for the renewal, because standing instructions cannot hold files and a negotiation always involves documents

Project banana chahiye tha

D) He never reviewed his stored context, and the course's rule is to wipe stored memory fully clean at the start of every quarter

Har quarter memory saaf karein

✓ **Correct answer / Sahi jawab: B**

Explanation: Instructions for stable rules, memory for evolving context, projects for scoped work. The most common configuration mistake is putting one in another's place.

Wazahat: Instructions = mustaqil qawaid; memory = badalta context; projects = mehdood kaam. Sab se aam ghalti aik ko doosre ki jagah rakhna hai.

Q7. A lawyer uses an incognito chat to think through a sensitive matter, and tells a colleague the conversation 'does not exist anywhere.' How should the course correct her?

Aik wakeel naazuk maamle ke liye incognito chat use karti hai aur kehti hai ke guftagu 'kahin mojood nahi.' Course kaise islah karega?

- A) Incognito applies only to memory and not to history, so the conversation is still listed in her sidebar where anyone at her screen could open it
Incognito sirf memory par lagu, history par nahi
- B) She is right about the vendor but wrong about her firm, because an organization's retention policy is the only thing that ever keeps such a chat
Vendor ke baare mein sahi, firm ke baare mein ghalat
- C) It is kept out of history and out of memory, but the vendor still retains a copy temporarily, so it is memory-free rather than trace-free
History aur memory se bahar hai, magar vendor aarzi taur par copy rakhta hai — memory-free hai, trace-free nahi
- D) Incognito chats can be converted back into normal chats later, so the content can re-enter both history and memory without warning
Incognito ko normal chat bana sakte hain

✓ **Correct answer / Sahi jawab: C**

Explanation: Both vendors retain a copy for roughly thirty days for safety and abuse review — memory-free, not trace-free. Incognito cannot be converted back to a normal chat.

Wazahat: *Dono vendors taqreeban tees din safety review ke liye copy rakhte hain — memory-free, trace-free nahi. Incognito chat wapas normal nahi banti.*

Q8. A reader follows a 2025 tutorial that tells him to open canvas in ChatGPT to edit a long document, and cannot find the button anywhere. What is actually going on?

Reader 2025 ka tutorial follow karta hai jo ChatGPT mein canvas kholne ko kehta hai, magar button nahi milta. Asal mein kya ho raha hai?

- A) Canvas is now a paid-plan feature, so the button is hidden on his account until he upgrades to a plan that includes the editing panel
Canvas ab paid hai
- B) Canvas only appears once a response passes a length threshold, so a short draft will never trigger the side panel the tutorial describes
Canvas sirf lambe jawab par aata hai
- C) He is looking in the wrong product, since the side-by-side editing surface the tutorial describes has always belonged to Claude artifacts
Ghalat product dekh raha hai
- D) OpenAI retired canvas on its current models and moved that same work into the thread as inline writing blocks and code blocks instead
OpenAI ne canvas khatam kar diya aur yeh kaam thread ke andar writing blocks aur code blocks mein chala gaya

✓ **Correct answer / Sahi jawab: D**

Explanation: Canvas was removed in 2026 and the same job now happens inline, in editable writing blocks and code blocks. The design changed; the idea — work product separate from the discussion — did not.

Wazahat: *Canvas 2026 mein hata diya gaya; ab yeh kaam inline editable writing/code blocks mein hota hai. Design badla, khayal nahi — kaam ki cheez guftagu se alag rehti hai.*

Q9. An accountant has a project holding one client's filings and a written method for preparing their year-end pack. She wants the method applied to a second client. What does the course's split tell her?

Accountant ke project mein aik client ki filings aur year-end pack ka likha hua tareeqa hai. Woh yeh tareeqa doosre client par lagana chahti hai. Course ki taqseem kya batati hai?

- A) The method belongs in a standalone skill, because a skill carries the how and can be redirected at whichever project supplies the what
Tareeqa alag skill mein jaye — skill 'kaise' rakhti hai aur kisi bhi project ke 'kya' par chal sakti hai
- B) She should duplicate the project, because the method and the filings were built together and separating them will break the instructions
Project duplicate karein
- C) She should build a custom GPT, because a separately configured assistant is the only way to reuse a method across two different clients
Custom GPT banayein
- D) She should install a plugin, because reusing one method across two clients is precisely the job that a bundled package is designed for
Plugin install karein

✓ **Correct answer / Sahi jawab: A**

Explanation: Projects store knowledge; skills perform tasks. The method is the how, and packaging it as a skill lets it run against either client's files.

Wazahat: *Projects ilm rakhte hain; skills kaam karti hain. Tareeqa 'kaise' hai — skill bana kar kisi bhi client ki files par chalaya ja sakta hai.*

Q10. An operations lead hears MCP described as USB-C for AI tools and concludes that connecting his company's ticketing system is a routine, low-stakes step. Where does the shorthand mislead him?

Operations lead sunta hai MCP 'AI tools ka USB-C' hai aur samajhta hai ke company ka ticketing system jodna aam, kam khatre ka qadam hai. Yeh misaal kahan gumraah karti hai?

- A) MCP is a developer standard rather than a user-facing one, so a business user cannot connect a system without engineering help anyway
MCP sirf developers ke liye
- B) A standard plug makes connecting easy, but it is still a decision about what the assistant may read and do, which is not standardized
Standard plug jodna aasaan banata hai, magar yeh phir bhi faisla hai ke assistant kya parh aur kar sakta hai — yeh standard nahi
- C) USB-C describes Claude connectors accurately and ChatGPT apps only loosely, since the two ecosystems implement the protocol in different ways
USB-C sirf Claude par sahi
- D) Ticketing systems are the one category the standard does not cover well, so the comparison holds for storage and calendars but not for tickets
Ticketing systems cover nahi hote

✓ **Correct answer / Sahi jawab: B**

Explanation: The plug is standard; the access is not. Connecting a tool is a trust decision: what can it read, can it act, do you trust the source, are you allowed to connect it.

Wazahat: *Plug standard hai; access nahi. Tool jodna bharse ka faisla hai: kya parh sakta hai, kya amal kar sakta hai, source par bharsa hai, aur ijazat hai ya nahi.*

Q11. Someone starts a research run to find out which of two suppliers currently has the shorter published lead time, then waits several minutes for a cited report. What does the course call this?

Koi research run shuru karta hai yeh jaanne ke liye ke do suppliers mein kiska lead time kam hai, aur kai minute cited report ka intezaar karta hai. Course ise kya kehta hai?

- A) A reasonable use of research, because a cited report is the only defensible evidence to bring to a supplier decision of any size
Research ka munasib istemal
- B) A permission problem, because supplier lead times usually sit behind a connected system rather than on the open web where research looks
Permission ka masla
- C) Misrouting, and the most common daily waste in both cockpits, since one current fact is what the web search toggle answers in seconds
Ghalat routing — dono cockpits ka sab se aam roz ka zaya; aik taaza fact web search seconds mein de deta
- D) A context problem, because the assistant was never told which two suppliers to compare or where their published lead times are listed
Context ka masla

✓ **Correct answer / Sahi jawab: C**

Explanation: Route the question before you send it. One current fact → search; deep reasoning with no new information → thinking; thorough multi-source investigation → research.

Wazahat: Bhejne se pehle sawal ka raasta chunein: aik taaza fact → search; nayi maloomat ke baghair gehri soch → thinking; kai sources wali tehqeeq → research.

Q12. A team reproduces last quarter's commission report with an assistant, matches their own numbers exactly, and proposes letting it run this quarter's report unreviewed. What does the course say the test earned them?

Team pichhle quarter ki commission report assistant se dobara banati hai, numbers bilkul milte hain, aur is quarter ki report bina review chalane ki tajweez deti hai. Course ke mutabiq test se unhein kya mila?

- A) Nothing yet, because a single matching run is not a sample, and the loop requires the same case to be reproduced several times over
Abhi kuch nahi, aik run sample nahi
- B) Confidence in the instructions rather than in the assistant, so the same instructions would now work unreviewed in either product
Instructions par bharosa, assistant par nahi
- C) Proof for similar work, which is enough to remove review from the recurring report while keeping it for anything unusual
Milte julte kaam ka saboot, review hata sakte hain
- D) Earned confidence for similar future work and nothing more, since passing a test never transfers the accountability for what ships
Milte julte aainda kaam ke liye kamaya hua bharosa, bas — test pass karna zimmedari muntaqil nahi karta

✓ **Correct answer / Sahi jawab: D**

Explanation: Passing earns confidence; it never transfers accountability. They still verify new results, stand behind the output, and disclose where it matters.

Wazahat: Pass karna bharosa deta hai, zimmedari muntaqil nahi karta. Naye nataij phir bhi verify karein, output ke zimmedar rahein, aur jahan zaroori ho batayein.

Flashcards — 8 cards

Card 1. Why should you learn the model tier pattern before the current model names?

Model ke naam se pehle tier pattern kyun seekhein?

Answer: Model names and versions change fast. The pattern (fast, thinking, flagship) lasts longer and lets you choose by task. Then learn the current names and which level each sits on.

Jawab: Naam aur versions tezi se badalte hain. Pattern (fast, thinking, flagship) zyada der chalta hai aur kaam ke mutabiq chunne deta hai. Phir mojudaa naam aur unka level seekhein.

Card 2. When should you use thinking mode?

Thinking mode kab use karein?

Answer: For multi-step reasoning, careful analysis, math, difficult code, and anything where extra reasoning is worth the wait.

Jawab: Kai qadam wali reasoning, ghaur-talab analysis, math, mushkil code, aur jahan izafi soch intezaar ke layak ho.

Card 3. What is the rule separating instructions, memory, and projects?

Instructions, memory aur projects ko alag karne ka qaida?

Answer: Instructions for stable rules, memory for evolving context, projects for scoped work.

Jawab: Instructions = mustaqil qawaid; memory = badalta context; projects = mehdood kaam.

Card 4. What is the difference between ordinary chat and an artifact or writing block, and what changes when the work is data or a number you will act on?

Aam chat aur artifact/writing block mein farq, aur data ya amal wale number par kya badalta hai?

Answer: Chat is the conversation; artifacts/blocks hold a distinct editable work product. Data → ask for a table or spreadsheet file. A number someone will act on → ask for it computed by code, and check which column the code used.

Jawab: Chat guftagu hai; artifacts/blocks alag editable kaam ki cheez. Data ho to table ya spreadsheet file maangein. Amal wala number ho to code se hisaab karwayein aur dekhein code ne kaunsa column use kiya.

Card 5. Complete: projects store __; skills perform __.

Mukammal karein: projects __ rakhte hain; skills __ karti hain.

Answer: Projects store knowledge; skills perform tasks.

Jawab: Projects ilm (knowledge) rakhte hain; skills kaam (tasks) karti hain.

Card 6. What is MCP, and why does it matter when you use more than one assistant?

MCP kya hai aur kai assistants mein kyun ahem?

Answer: The Model Context Protocol, an open standard for connecting AI systems to outside tools and data. Integration concepts, and often the tools, carry across products.

Jawab: Model Context Protocol — AI ko bahar ke tools aur data se jodne ka khula standard. Integration ke concepts aur aksar tools bhi products ke darmiyan chalte hain.

Card 7. Why should your first AI test use an old case whose correct result you already know?

Pehla AI test aise purane case par kyun jiska sahi nateeja maloom ho?

Answer: You need a trusted answer to compare against. Without known truth you cannot tell whether the assistant reproduced the work or just sounded like it did.

Jawab: Muqablay ke liye bharosemand jawab chahiye. Maloom sach ke baghair pata nahi chalta ke assistant ne kaam dohraya ya sirf aisa lagta hai.

Card 8. What does passing that test give you, and what does it never transfer?

Test pass karne se kya milta hai, aur kya kabhi muntaqil nahi hota?

Answer: Tested confidence for similar future work. It never transfers accountability: you still verify important outputs and stand behind the result.

Jawab: Milte julte kaam ke liye aazmaya hua bharosa. Zimmedari kabhi muntaqil nahi hoti: ahem output verify karein aur nateeje ke zimmedar rahein.

Course 6: Skills & Connectors

<https://agentfactory.panaversity.org/docs/skills-connectors-crash-course>

Practice Test — 29 MCQs

Q1. A teacher pastes the same brand-voice and formatting rules into a fresh chat every single week, and the AI forgets them the moment each chat ends. Which one sentence captures the difference Skills and Connectors make?

Teacher har hafte nayi chat mein wahi brand-voice aur formatting rules paste karti hai, aur chat khatam hote hi AI bhool jata hai. Kaunsa aik jumla Skills aur Connectors ka farq batata hai?

- A) A Skill and a Connector are really two names for the same upgrade, so installing either one will end the repeated pasting
Skill aur Connector aik hi cheez ke do naam
- B) A Connector teaches AI how to do a task your way, while a Skill is the safe link that lets it reach your files and email
Connector 'kaise' sikhata hai, Skill files tak raasta
- C) The only real fix is a longer chat, because keeping one conversation open forever stops the AI from forgetting your rules
Sirf lambi chat hal hai
- D) A chat tells AI what to do once, a Skill teaches it how every time, and a Connector gives it hands to reach your apps
Chat aik baar batati hai kya karna hai, Skill har baar sikhati hai kaise, Connector apps tak pahunchne ke haath deta hai

✓ **Correct answer / Sahi jawab: D**

Explanation: A chat is one-time, a Skill is the repeatable how, a Connector is access to your apps. One is expertise, one is access.

Wazahat: Chat aik baar ki, Skill baar baar ka 'kaise', Connector apps tak rasai. Aik maharat hai, doosra access.

Q2. In the kitchen analogy the course uses, what do Connectors and Skills each map to, and why does the pairing matter?

Course ki kitchen misaal mein Connectors aur Skills kis cheez ke barabar hain, aur jodi kyun ahem hai?

- A) Connectors are the recipe cards and Skills are the fully stocked pantry, so together they let absolutely any cook improvise a completely brand-new dish
Connectors recipe cards, Skills pantry
- B) Connectors are the kitchen (stove, knives, your real ingredients) and Skills are the recipe cards, so together AI cooks your dish reliably
Connectors kitchen hain (chulha, chhuriyan, asal ajza), Skills recipe cards — dono mil kar AI aapki dish bharose se banata hai
- C) Both are just the cookbook, so owning either one alone is already enough to produce a consistent result without the other
Dono cookbook hain
- D) Connectors are the head chef and Skills are the waiters, so the analogy is about who gives orders to whom in the kitchen
Connectors head chef, Skills waiters

✓ **Correct answer / Sahi jawab: B**

Explanation: Connectors = the kitchen and stocked pantry (tools and your real data); Skills = the recipe cards (your steps, your way). Neither alone suffices.

Wazahat: Connectors = kitchen aur pantry (tools aur asal data); Skills = recipe cards (aapke steps, aapka tareeqa). Akele koi kaafi nahi.

Q3. An accountant re-explains her exact report formatting (reporting currency, grouping by expense head, a withholding flag, her template) at the start of every monthly chat. The course says this shape is built for which feature?

Accountant har mahine ki chat ke shuru mein apni report formatting (currency, expense head grouping, withholding flag, template) dobara samjhati hai. Course ke mutabiq yeh kis feature ke liye bana hai?

- A) A Skill, because it is a repeatable task done her specific way where only the input changes month to month
Skill — dohraya jane wala kaam uske khaas tareeqe se, sirf input badalta hai
- B) A Connector, because the friction is that the formatting rules live inside another app she keeps copying them out of each time
Connector
- C) Custom instructions, because formatting a monthly report is a global style preference that should apply to every chat she ever opens
Custom instructions
- D) A Project, because the report needs the same standing files loaded automatically into every chat inside that workspace
Project

✓ **Correct answer / Sahi jawab: A**

Explanation: A repeatable task done a specific way with only the input changing is exactly a Skill. Not a Connector (the friction is re-explaining how), not custom instructions (one task, not global style), not a Project (needs a procedure on demand).

Wazahat: Aik khaas tareeqe se dohraya jane wala kaam jismein sirf input badle = Skill. Connector nahi (masla 'kaise' samjhana hai), custom instructions nahi (aik kaam hai), Project nahi (tareeqa chahiye, files nahi).

Q4. Once you strip away the mystery, the course says a Skill is fundamentally what?

Raaz hata dein to course ke mutabiq Skill buniyadi taur par kya hai?

- A) A small piece of software an engineer writes in code, which you install by clicking Connect and never have to read
Engineer ka likha software
- B) A saved chat history that the AI replays whenever you return to the same topic in a later conversation
Saved chat history
- C) A folder with a text file named SKILL.md in it, holding a name, a description, and plain-English instructions
Aik folder jismein SKILL.md text file ho — naam, description aur saada English hidayaat
- D) A live dashboard the AI renders inside the conversation so you can click through your data visually
Live dashboard

✓ **Correct answer / Sahi jawab: C**

Explanation: A Skill is a folder with a SKILL.md text file holding a name, a description, and instructions, with no code required to start.

Wazahat: Skill aik folder hai jismein SKILL.md file ho — naam, description aur hidayaat. Shuru karne ke liye code ki zaroorat nahi.

Q5. The course says AI loads skills 'dynamically' through what it calls progressive disclosure. What does that actually mean in practice?

Course kehta hai AI skills ko 'progressive disclosure' ke zariye load karta hai. Amli taur par iska kya matlab hai?

- A) AI rewrites each skill's instructions from scratch every time, so the same skill behaves a little differently on each run
Har baar hidayaat nayi likhta hai
- B) AI keeps only a short description of each skill loaded and opens the full instructions only when your request matches one
Har skill ki sirf chhoti description load rehti hai; poori hidayaat tab khulti hain jab request match ho
- C) AI loads every installed skill in full at all times, which is why having many skills installed gradually slows it down
Sab skills poori load rehti hain
- D) AI reveals each skill to you one step at a time as you scroll, so you discover what is installed gradually over a session
Scroll karte hue skills dikhata hai

✓ **Correct answer / Sahi jawab: B**

Explanation: AI keeps only the short description loaded and opens the full instructions when a request matches, which is why dozens of skills can be installed without slowing it down.

Wazahat: AI sirf chhoti description load rakhta hai aur match hone par poori hidayaat kholta hai — is liye darjaanon skills bhi raftaar kam nahi karti.

Q6. A doctor worries that connecting Google Drive will hand the AI his entire hospital's drive. What does the course say about a connector's reach?

Doctor darta hai ke Google Drive jodne se AI ko poore hospital ki drive mil jayegi. Course connector ki pahunch ke baare mein kya kehta hai?

- A) A connector grants AI broad read access to the whole service, so his worry is correct unless he disables it after each use
Poori service tak access, fikr sahi
- B) A connector reaches only files you have opened recently, so older documents in the drive stay invisible to the AI entirely
Sirf haal hi mein kholi files
- C) A connector copies the connected app's data onto the provider's servers, so reach depends on how much has finished syncing
Data provider ke servers par copy hota hai
- D) AI inherits your permissions, so a connector can never reach anything your own account cannot already open in the app
AI aapki ijazatein warasat mein leta hai — jo aapka account nahi khol sakta woh connector bhi nahi

✓ **Correct answer / Sahi jawab: D**

Explanation: AI inherits your permissions: it can never reach what your own account cannot. Reach is defined by your access, live, not by bulk copying.

Wazahat: AI aapki ijazatein leta hai: jo aapka account nahi khol sakta woh AI bhi nahi. Pahunch aapke access se tay hoti hai.

Q7. The course says good practice with a brand-new connector is to start read-only. What distinguishes a read-only action from a write action?

Naye connector ke saath read-only se shuru karna achha hai. Read-only aur write action mein kya farq hai?

- A) Read-only means the connector works offline, while write actions are the ones that require a live internet connection to run
Read-only offline hai
- B) Read-only means free-tier access, while write access is the paid upgrade that unlocks doing things in the connected app
Read-only free, write paid
- C) 'Search and summarize my email' is read-only and low-risk. 'Send this email' or 'create this issue' is a write action
'Email search aur khulasa karo' read-only aur kam khatra; 'yeh email bhejo' ya 'issue banao' write action
- D) Read-only applies to documents while write access applies to messages, so the split is really about which app you connect
Read-only documents ke liye, write messages ke liye

✓ **Correct answer / Sahi jawab: C**

Explanation: Read-only is looking without changing (search, summarize); write is editing or sending. Start read-only and earn up to write.

Wazahat: Read-only = dekhna, badalna nahi (search, khulasa); write = edit ya bhejna. Read-only se shuru karein, phir write tak pahunchen.

Q8. A beginner keeps confusing Skills with Projects. The course gives a clean test. Which statement draws the line correctly?

Beginner Skills aur Projects mein uljhan karta hai. Kaunsa bayan sahi lakeer kheenchta hai?

- A) A Project always loads its context when you open a chat in it. A Skill stays dormant until a request matches, then fires anywhere
Project chat kholte hi apna context load karta hai; Skill request match hone tak soti rehti hai, phir kahin bhi chalti hai
- B) A Project fires only when a request matches it, while a Skill is always loaded the moment you open any chat at all
Project match par, Skill hamesha
- C) A Project and a Skill are completely interchangeable, so the only real difference is whether you happen to be on a free or paid plan
Dono aik jaise
- D) A Skill applies to every chat you ever have, while a Project narrowly touches just one kind of task when triggered
Skill har chat par, Project aik kaam par

✓ **Correct answer / Sahi jawab: A**

Explanation: A Project always loads its context on open (standing background knowledge); a Skill stays dormant until matched, then fires anywhere, even outside a project.

Wazahat: Project kholte hi context load karta hai (mustaqil pas-e-manzar); Skill match tak soti hai, phir kahin bhi chalti hai, project ke bahar bhi.

Q9. In Claude.ai, a user types 'create a PowerPoint about Q3 results' without naming any skill, and the PowerPoint skill activates anyway. The course says this is the default behavior because of what?

Claude.ai mein user bina skill ka naam liye 'Q3 results par PowerPoint banao' likhta hai aur PowerPoint skill chal jati hai. Course ke mutabiq yeh default kyun hai?

- A) Skills in Claude.ai fire automatically: AI scans your request against each enabled skill's description and loads the match on its own
Claude.ai mein skills khud chalti hain — AI request ko har enabled skill ki description se milata hai aur match load karta hai
- B) Claude.ai requires a slash command for every skill, so the user must have typed one without realizing they had done it
Slash command zaroori hai
- C) PowerPoint is a special built-in exception here, so most other skills actually do require you to name them explicitly before they will run
PowerPoint khaas exception hai
- D) The skill fired because the user had it pinned as their single active skill, which removes the need to name it each time
Skill pinned thi

✓ **Correct answer / Sahi jawab: A**

Explanation: AI matches your plain-language request against the description of every enabled skill and loads the match, no slash command needed.

Wazahat: AI aapki saada request ko har enabled skill ki description se milata hai aur match load karta hai — slash command ki zaroorat nahi.

Q10. Auto-detection in Claude.ai occasionally misses, and a user wants to force a specific skill. The course names a method that works everywhere, including Claude.ai. Which is it?

Claude.ai mein auto-detection kabhi chook jata hai aur user khaas skill chalana chahta hai. Kaunsa tareeqa har jagah kaam karta hai?

- A) Type a slash to open a menu and pick the skill, which is the universal override available in every tool including the web app
Slash menu
- B) Re-upload the skill's zip file at the start of the chat, which re-registers it and forces it to take over the next request
Zip dobara upload
- C) Name the skill in plain English, such as 'use my brand-voice skill to draft this caption', which works in every tool
Saada English mein skill ka naam lein — 'meri brand-voice skill se caption likho' — har tool mein chalta hai
- D) Switch the conversation into developer mode, which is the only place naming a skill directly is actually supported
Developer mode

✓ **Correct answer / Sahi jawab: C**

Explanation: Naming the skill in plain English is the simplest override with no special syntax. Slash menus are in Cowork and the Office add-ins, not Claude.ai.

Wazahat: Saada English mein skill ka naam lena sab se aasaan tareeqa hai. Slash menu Cowork aur Office add-ins mein hai, Claude.ai mein nahi.

Q11. With 'Code execution and file creation' switched on in Claude.ai, a marketer asks 'turn this campaign plan into a slide deck' without naming a skill. What happens, and why?

Claude.ai mein 'Code execution and file creation' on hai; marketer bina skill ka naam liye 'is campaign plan ko slide deck banao' kehta hai. Kya hota hai aur kyun?

- A) Nothing, because deck creation always requires installing a partner skill from the directory before the feature works at all
Kuch nahi, partner skill chahiye
- B) The AI returns an outline of the deck as text, because Claude.ai cannot generate actual presentation files from a chat
Sirf text outline
- C) A slash menu appears first, because built-in file skills must be picked manually rather than triggered by a description
Pehle slash menu
- D) The built-in PowerPoint skill activates on its own and produces a real slide deck, because the built-ins fire automatically
Built-in PowerPoint skill khud chalti hai aur asli deck banati hai — built-ins khud fire hoti hain

✓ **Correct answer / Sahi jawab: D**

Explanation: The built-in Word, PowerPoint, Excel, and PDF skills activate automatically once file creation is on, producing real files you download.

Wazahat: File creation on ho to built-in Word, PowerPoint, Excel aur PDF skills khud chalti hain aur asli files banati hain.

Q12. The course says public marketplaces now list tens of thousands of community skills, and calls this 'a gift and a hazard'. What is the hazard?

Course kehta hai public marketplaces mein hazaron community skills hain — 'tohfa bhi aur khatra bhi'. Khatra kya hai?

- A) Community skills always cost real money to download, so the real hazard is slowly running up charges across many small purchases over time
Paise lagte hain
- B) A free skill from a stranger is a text file you are about to let AI follow, which can carry harmful hidden instructions
Ajnabi ki free skill aik text file hai jise AI follow karega — ismein nuqsan deh chhupi hidayaat ho sakti hain
- C) Community skills expire after a short trial, so the hazard is building a workflow on one that suddenly stops working
Trial ke baad expire
- D) There are too many to browse, so the hazard is simply the time wasted searching rather than any risk to your data
Bohat zyada hain, waqt zaya

✓ **Correct answer / Sahi jawab: B**

Explanation: A stranger's free skill is a text file you let AI follow, which can carry malicious hidden instructions; built-ins and the official directory are the safe start.

Wazahat: Ajnabi ki skill aik text file hai jise AI follow karta hai — ismein bad-niyat chhupi hidayaat ho sakti hain. Built-ins aur official directory mehfooz aaghaz hain.

Q13. After connecting Google Drive, a user asks a question in a fresh chat but the AI does not seem to use the drive. The course points to a likely setup step. Which is it?

Google Drive jodne ke baad user nayi chat mein sawal poochta hai magar AI drive use nahi karta. Kaunsa setup step reh gaya?

- A) The connector needs a paid plan to function in any conversation, so the free tier connected it but cannot actually use it
Paid plan chahiye
- B) The connector only ever activates after the drive finishes a complete background sync, which can take up to several hours after connecting
Ghanton ki sync
- C) The connector must be enabled for this specific conversation through the same plus or Connectors menu before the chat can use it
Connector ko is khaas chat ke liye plus ya Connectors menu se enable karna padta hai
- D) The connector requires you to name the exact file path every time, because AI cannot search a drive on its own at all
Har baar file path

✓ **Correct answer / Sahi jawab: C**

Explanation: Connecting an app makes it available, but you still enable it per conversation via the plus or Connectors menu.

Wazahat: App jodne se woh dastyab hoti hai, magar har chat mein plus/Connectors menu se enable karni padti hai.

Q14. The course describes the real payoff as Skills and Connectors working together. What is the exact division of labor in that pattern?

Asal faida Skills aur Connectors ke mil kar kaam karne mein hai. Kaam ki taqseem kya hai?

- A) The Connector fetches the real data and the Skill shapes the output your way, so one sentence produces a finished result
Connector asal data laata hai, Skill output ko aapke tareeqe se dhaalti hai — aik jumle se mukammal nateeja
- B) The Skill fetches the live data from your app and the Connector then reformats that data into the layout you prefer
Skill data laati hai, Connector format karta hai
- C) Both the Skill and the Connector fetch data independently, and you manually merge their two separate outputs at the end
Dono data laate hain, aap milate hain
- D) The Connector writes the instructions and the Skill stores your files, so together they replace the need to prompt at all
Connector hidayaat likhta hai, Skill files rakhti hai

✓ **Correct answer / Sahi jawab: A**

Explanation: The Connector fetches the real data and the Skill shapes the output your way, turning a two-hour ritual into a two-minute review.

Wazahat: Connector asal data laata hai, Skill use aapke andaaz mein dhaalti hai — do ghante ka kaam do minute ka review ban jata hai.

Q15. A user faces a recurring annoyance and wants to diagnose whether they need a Skill, a Connector, or both. The course gives a friction test. Which diagnosis is right?

User ko baar baar ki pareshani hai aur jaanna chahta hai Skill chahiye, Connector ya dono. Friction test ki sahi tashkhees?

- A) If you keep re-explaining how to do it you need a Connector. If you keep fetching data from an app you need a Skill
'Kaise' samjhana → Connector; data lana → Skill
- B) If you keep re-explaining how you need a Skill. If you keep fetching data from another app you need a Connector. If both, both
Baar baar 'kaise' samjhana → Skill; doosri app se data lana → Connector; dono → dono
- C) Any recurring annoyance needs both a Skill and a Connector together, because the two features only ever work as a pair
Hamesha dono
- D) A recurring annoyance is usually just a one-off after all, so the honest answer is almost always that you really need neither of them
Kuch nahi chahiye

✓ **Correct answer / Sahi jawab: B**

Explanation: Re-explaining how points to a Skill, copy-pasting from an app points to a Connector, doing both points to both.

Wazahat: 'Kaise' dobara samjhana = Skill; app se copy-paste = Connector; dono = dono.

Q16. The course gives two honest cautions when deciding whether to build a tool. What are they?

Tool banane ka faisla karte waqt course do imaandar ehtiyaat batata hai. Kaunsi?

- A) Always build a dedicated skill for any task, and always connect every single app you own so the AI has the fullest possible context available
Har kaam ki skill, har app connect
- B) Skills are dangerous so avoid building them, and connectors are safe so connect as many apps as you possibly can right away
Skills khatarnak, connectors mehfooz
- C) Build skills only on paid plans, and connect apps only on free plans, because the two features are gated to opposite tiers
Skills paid, connectors free
- D) Not every task deserves a skill (a one-off is just a good prompt), and a connector you do not need is a door left open
Har kaam skill ke layak nahi (aik baar ka kaam = achha prompt), aur ghair-zaroori connector khula darwaza hai

✓ **Correct answer / Sahi jawab: D**

Explanation: A one-off task is just a good prompt; a skill is worth it only when the task repeats. An unneeded connector is an open door, so scope is safety.

Wazahat: Aik baar ka kaam achha prompt hai; skill tab jab kaam dohraye. Ghair-zaroori connector khula darwaza hai — mehdood daira hi hifazat hai.

Q17. The course says you build your own skill without writing code. What is the fastest path it describes?

Course kehta hai apni skill bina code ke banti hai. Sab se tez raasta kya hai?

- A) Open a code editor and fill in a SKILL.md template by hand, then carefully test each line of the instructions yourself
Code editor mein template bharein
- B) Record yourself doing the task once, then upload the recording so the AI can convert your actions into a skill automatically
Recording upload karein
- C) Copy a stranger's community skill that is closest to your task, since editing someone else's draft is usually faster than describing your own
Ajnabi ki skill copy karein
- D) Use the skill-creator skill: describe what you want in plain English, answer its clarifying questions, and let it write the SKILL.md
skill-creator skill use karein: saada English mein batayein, uske sawalon ke jawab dein, woh SKILL.md likh degi

✓ **Correct answer / Sahi jawab: D**

Explanation: The skill-creator skill: you describe the task, it asks clarifying questions, then generates the SKILL.md for you, no code written.

Wazahat: skill-creator skill: aap kaam batayein, woh sawal poochti hai, phir SKILL.md bana deti hai — koi code nahi.

Q18. Inside a SKILL.md, the course says only one part stays loaded at all times. Which part, and what is its job?

SKILL.md mein sirf aik hissa hamesha load rehta hai. Kaunsa aur uska kaam?

- A) The body of instructions, because AI must keep the full numbered steps in mind at all times to know whether the skill is relevant
Hidayaahat ka body
- B) The references folder, because the detailed docs are what AI consults first before deciding to load anything else at all
References folder
- C) The frontmatter name and description, because that is what AI reads to decide whether this skill is relevant to a request
Frontmatter ka naam aur description — AI isi se tay karta hai skill request se mutalliq hai ya nahi
- D) The example section, because a worked example is what AI matches your request against before opening the instructions
Example section

✓ **Correct answer / Sahi jawab: C**

Explanation: Only the frontmatter (name and description) stays loaded, because that is how AI decides relevance. The body loads when matched; references only as needed.

Wazahat: Sirf frontmatter (naam aur description) load rehta hai — isi se relevance tay hoti hai. Body match par, references zaroorat par.

Q19. A user names their skill folder 'Client Monthly Summary' and the upload misbehaves. Based on the SKILL.md rules, what is wrong?

User skill folder ka naam 'Client Monthly Summary' rakhta hai aur upload theek nahi hota. Kya ghalat hai?

- A) The folder name must use kebab-case like 'client-monthly-summary', not spaces or capitals or underscores between the words
Folder ka naam kebab-case ho — 'client-monthly-summary' — spaces, capitals ya underscores nahi
- B) The folder name is fine, so the real problem must be that the SKILL.md file was accidentally named something other than SKILL.md
Naam theek hai, file ka naam ghalat
- C) Folder names must be a single word with no separators at all, so even hyphens between the words would cause the same failure
Aik lafz ho
- D) Folder names must start with the word 'skill', so the fix is to rename it to something like 'skill-client-monthly-summary'
'skill' se shuru ho

✓ **Correct answer / Sahi jawab: A**

Explanation: The rule is kebab-case for the folder name (client-monthly-summary), not spaces, capitals, or underscores.

Wazahat: Folder ka naam kebab-case mein ho (client-monthly-summary) — spaces, capitals ya underscores nahi.

Q20. The course says one field decides whether a skill ever fires. Which field, and why does it carry that weight?

Aik field tay karti hai skill kabhi chalegi ya nahi. Kaunsi aur kyun?

- A) The instructions, because AI carefully reads the full body of numbered steps to judge whether your current request is a relevant match for it
Instructions
- B) The description, because AI reads only it (not your instructions) to decide relevance, so a vague one means a skill that never triggers
Description — AI relevance ke liye sirf ise parhta hai; mubham description = skill kabhi nahi chalegi
- C) The name, because AI matches your request against the skill's name and ignores everything else when deciding relevance
Naam
- D) The example, because AI compares your wording to the worked example and fires the skill only on a close enough resemblance
Example

✓ **Correct answer / Sahi jawab: B**

Explanation: AI reads only the description to judge relevance, so a vague description means a skill that never triggers and a sharp one fires at the right moment.

Wazahat: AI relevance ke liye sirf description parhta hai — mubham ho to skill nahi chalti, wazeh ho to sahi waqt par chalti hai.

Q21. A user's skill keeps firing on quick one-off questions it should ignore. The course names a tool for this. What is it?

User ki skill un chhote sawalon par bhi chal jati hai jin par nahi chalni chahiye. Course kaunsa hal batata hai?

- A) A shorter set of instructions, since trimming the body is what stops a skill from taking over requests it should not handle
Chhoti hidayaat
- B) A negative trigger in the description, such as 'Do NOT use for one-off calculations or quick questions, only full reports'
Description mein negative trigger — 'aik baar ke hisaab ya chhote sawalon ke liye use NA karo, sirf पूरी reports'
- C) A higher priority setting, which tells AI to reserve the skill for important requests and skip it on trivial ones automatically
Priority setting
- D) Renaming the skill with a more specific name, since the name is what AI checks before deciding whether to fire the skill
Naam badlein

✓ **Correct answer / Sahi jawab: B**

Explanation: The fix for over-eager firing is a negative trigger in the description telling AI when not to use the skill.

Wazahat: Zyada chalne ka hal: description mein negative trigger jo batata hai kab skill use NA ho.

Q22. The course describes a reliable build loop for a new skill. After generating and reading the draft, what does it say to test, beyond just the output?

Nayi skill ke liye build loop mein draft parhne ke baad output ke ilawa kya test karein?

- A) Triggering: try phrases that should activate it and confirm it loads, and try unrelated requests to confirm it does not take over
Triggering — jin jumlon par chalni chahiye un par chalti hai, aur be-ta'alluq requests par qabza nahi karti
- B) Only the output formatting itself, because if a skill produces the right format then its triggering can simply be assumed to work correctly
Sirf formatting
- C) Only the file size, because a skill that stays under the character limit is guaranteed to both trigger and run correctly
Sirf file size
- D) Only the speed, because the single thing worth measuring is how quickly the skill returns its result once it has fired
Sirf raftaar

✓ **Correct answer / Sahi jawab: A**

Explanation: Test triggering as well as output: confirm the phrases that should activate it do, and that unrelated requests do not get hijacked.

Wazahat: Output ke saath triggering bhi test karein: sahi jumlon par chale aur be-ta'alluq requests par na chale.

Q23. A user's new skill simply never activates, no matter how they phrase the request. The course's timing list points to which cause and fix?

User ki nayi skill kabhi chalti hi nahi. Course ki list kaunsi wajah aur hal batati hai?

- A) The description is too broad, so the fix is to widen it further with more general words until the skill finally catches on

Description bohat wasee, aur wasee karein

- B) The instructions are too long, so the fix is to cut the body down until the skill becomes light enough to trigger reliably

Hidayaah lambi, chhoti karein

- C) The skill needs to be re-uploaded several times, because activation only becomes reliable after repeated installs of the same file

Kai baar upload karein

- D) The description is too vague or missing the words you actually use, so the fix is to add those exact phrases to it

Description mubham hai ya usmein woh alfaaz nahi jo aap bolte hain — wahi alfaaz shamil karein

✓ **Correct answer / Sahi jawab: D**

Explanation: A skill that never triggers: the description is too vague or missing the words you actually say; fix by adding those phrases.

Wazahat: Skill na chale to description mubham hai ya aapke alfaaz nahi — wahi alfaaz shamil karein.

Q24. On a Team or Enterprise plan, a firm wants every accountant to use the same client-summary skill and have it stay current. What does the course say about shared skills?

Team/Enterprise plan par firm chahti hai har accountant aik hi skill use kare aur woh update rahe. Shared skills ke baare mein course kya kehta hai?

- A) Shared skills are editable copies, so each colleague must manually re-download the latest version whenever the original changes

Editable copies, dobara download

- B) Shared skills work only while the author is online, so the firm depends on one person keeping their account active at all times

Sirf author online ho to

- C) Shared skills are view-only and auto-update when you change the original, which standardizes how a whole team produces documents

Shared skills view-only hain aur original badalne par khud update hoti hain — poori team ke documents yaksan

- D) Sharing is on by default for everyone, so any colleague can publish a skill to the whole organization without an owner approving

Sharing sab ke liye default on

✓ **Correct answer / Sahi jawab: C**

Explanation: Shared skills are view-only and auto-update when the original changes. Sharing is off by default until an owner enables it.

Wazahat: Shared skills view-only hain aur khud update hoti hain. Sharing default band hai jab tak owner on na kare.

Q25. The course says a skill written once is portable across tools, but adds an honest caveat. What is the caveat?

Aik baar likhi skill tools ke darmiyan portable hai, magar aik ehtiyaat hai. Kya?

- A) A basic SKILL.md travels across skills-compatible tools, but each product adds its own install path, syntax, and extra features
Buniyadi SKILL.md skills-compatible tools mein chalti hai, magar har product apna install tareeqa, syntax aur features jodta hai
- B) Portability is a marketing claim only, so in practice a SKILL.md written in one tool rarely runs in any other tool at all
Sirf marketing
- C) Skills are portable only between Anthropic's own tools, so moving any one of them to an OpenAI or Google tool is not actually possible
Sirf Anthropic tools
- D) Portability requires paying for each tool you move the skill into, so the open standard saves effort but never saves money
Har tool ke paise

✓ **Correct answer / Sahi jawab: A**

Explanation: The core SKILL.md travels; each product layers on its own install path, way to call a skill, permissions, and features. The core is portable, the edges differ.

Wazahat: Buniyadi SKILL.md har jagah chalti hai; har product apna install, call karne ka tareeqa aur features rakhta hai. Markaz portable, kinare mukhtalif.

Q26. A user asks whether ChatGPT's Custom GPTs and Gemini's Gems are the same kind of thing as a Skill. What is the course's precise answer?

User poochta hai kya ChatGPT ke Custom GPTs aur Gemini ke Gems Skill jaise hain. Course ka jawab?

- A) They are identical to Skills, so a GPT or Gem you build will run unchanged across Claude, ChatGPT, and Gemini alike
Bilkul aik jaise
- B) GPTs and Gems are the portable ones but Skills stay locked to Claude, so for a multi-tool strategy you should prefer GPTs and Gems instead
GPTs/Gems portable, Skills Claude tak
- C) They are all the same except in price, so the only real decision between a Skill, a GPT, and a Gem is which costs you less
Sirf qeemat ka farq
- D) A Skill is portable across many tools by open standard, while a GPT or Gem is a vendor-specific assistant you cannot take elsewhere
Skill khule standard se kai tools mein chalti hai; GPT ya Gem aik vendor ka assistant hai jo kahin aur nahi le ja sakte

✓ **Correct answer / Sahi jawab: D**

Explanation: A Skill is portable by open standard; a GPT or Gem is a vendor-specific custom assistant locked to its product.

Wazahat: Skill khule standard se portable hai; GPT ya Gem apne product tak mehdood assistant hai.

Q27. The course warns that a skill from a stranger deserves caution and names two specific dangers. Which pair does it name?

Ajnabi ki skill ke do khaas khatre kaunse hain?

- A) Slow performance and high cost, because a poorly written community skill makes the AI run slower and bill you for more
Dheemi raftaar aur zyada kharch
- B) Prompt injection (the skill manipulates AI into unintended actions) and data exfiltration (it secretly sends your information out)
Prompt injection (AI se anchahe kaam karwana) aur data exfiltration (chupke se maloomat bahar bhejna)
- C) Outdated instructions and broken links, because community skills are rarely maintained and stop working over time
Purani hidayaat, toote links
- D) Format errors and outright upload failures, because a stranger's skill often uses the wrong folder name or an invalid character limit somewhere
Format ghaltiyan

✓ **Correct answer / Sahi jawab: B**

Explanation: The two named dangers are prompt injection and data exfiltration.

Wazahat: Do khatre: prompt injection aur data exfiltration.

Q28. Before enabling a skill they did not write, a careful user wants to vet it. The course suggests a move that needs no technical skill. What is it?

Kisi aur ki likhi skill enable karne se pehle jaanch ka aisa tareeqa jismein technical maharat na chahiye?

- A) Run the skill once on fake data and assume it is safe if nothing visibly bad happens during that single trial run
Nakli data par aik baar chalayein
- B) Check that the folder name is kebab-case, since a correctly named skill is reliably a safe one to enable and trust
Kebab-case check karein
- C) Ask AI to read the skill and tell you exactly what it instructs, flagging anything that contacts servers or could leak data
AI se skill parhwa kar poochein yeh kya hidayat deti hai — servers se rabta ya data leak wali cheez flag karwayein
- D) Confirm the whole skill is safely under the character limit, because a skill short enough to upload cannot really contain harmful instructions
Character limit check karein

✓ **Correct answer / Sahi jawab: C**

Explanation: Ask AI to read the skill and report exactly what it instructs, flagging anything that reaches external servers, handles credentials, or could leak data.

Wazahat: AI se skill parhwayein aur poochein kya hidayat deti hai — bahar ke servers, credentials ya data leak wali cheezein flag karwayein.

Q29. The course closes the safety section with a principle about how caution should change as you do more. What is it?

Safety section ka aakhri usool: zyada karne par ehtiyaat kaise badle?

- A) Caution should drop as you gain experience, since once you have used a few skills the remaining risks become negligible
Tajurbe ke saath ehtiyaat kam
- B) Caution matters only for connectors, not for skills, because a skill is just text and text can never actually harm anything
Sirf connectors ke liye
- C) Caution should be highest at the very start and then relaxed permanently, since the built-in tools train you to spot every risk
Shuru mein zyada, phir hamesha kam
- D) Capability and care go up together: as you move to community skills and write access, your caution should rise to match
Salahiyat aur ehtiyaat saath barhte hain — community skills aur write access ki taraf jayein to ehtiyaat bhi barhayein

✓ **Correct answer / Sahi jawab: D**

Explanation: Capability and care go up together: as you move from built-in tools to community skills and write access, caution should rise to match.

Wazahat: *Salahiyat aur ehtiyaat saath barhte hain: built-in se community skills aur write access tak jaate hue ehtiyaat bhi barhe.*

Course 7: General Agents on the Web

<https://agentfactory.panaversity.org/docs/general-agents-web-crash-course>

Practice Test — 28 MCQs

Q1. A teammate types, "Every Monday at 8, summarize last week's support emails and save the brief." Is that ordinary chat or delegated agent work?

Saathi likhta hai: 'Har Monday 8 baje pichhle hafte ki support emails ka khulasa karo aur brief save karo.' Yeh aam chat hai ya delegated agent work?

- A) Delegated work, because it can run without another turn
Delegated work — yeh agle message ke baghair chal sakta hai
- B) Ordinary chat, because the instruction began in the chat box
Aam chat — chat box mein shuru hua
- C) A connector workflow, because the task reads support email
Connector workflow — email parhta hai
- D) A local session, because the task starts on a weekly schedule
Local session — haftawar schedule

✓ **Correct answer / Sahi jawab: A**

Explanation: Use the stop-typing test. The work starts later and continues without another message, so it is delegated agent work. A connector is only how it reaches email; a schedule does not make it local.

Wazahat: 'Typing band' test: kaam baad mein shuru ho kar bina naye message ke chalta hai, is liye delegated agent work hai. Connector sirf email tak pahunchne ka zariya; schedule se session local nahi banta.

Q2. Ayesha starts a cloud report from her laptop, closes it, and later checks the same session from her phone. Why can the work continue?

Ayesha laptop se cloud report shuru karti hai, laptop band karti hai, aur baad mein phone se wahi session dekhti hai. Kaam kyun chalta rehta hai?

- A) The laptop keeps a hidden local worker alive in the background
Laptop chhupa worker chalata hai
- B) The agent loop is running on the vendor's cloud infrastructure
Agent loop vendor ke cloud par chal raha hai
- C) The phone takes over as the runtime when the laptop closes
Phone runtime ban jata hai
- D) The email connector stores and executes the complete workflow
Email connector workflow chalata hai

✓ **Correct answer / Sahi jawab: B**

Explanation: In a cloud session, the browser or app is a window onto a loop running on vendor infrastructure. The phone is another control surface, not the machine doing the work.

Wazahat: Cloud session mein browser/app sirf khidki hai; loop vendor ke infrastructure par chalta hai. Phone control ki aik aur jagah hai, kaam karne wali machine nahi.

Q3. A cloud Cowork task needs a local folder through Claude Desktop. What happens if the desktop app goes offline halfway through?

Cloud Cowork task ko Claude Desktop ke zariye local folder chahiye. Agar desktop app beech mein offline ho jaye to?

- A) The task is deleted because every required tool must stay online
Task delete ho jata hai
- B) The task automatically converts itself into a fully local session
Task khud local ban jata hai
- C) The cloud loop continues, but the bridged local tool goes offline
Cloud loop chalta rehta hai, magar bridge wala local tool offline ho jata hai
- D) Nothing changes because cloud sessions can always read local files
Kuch nahi badalta

✓ **Correct answer / Sahi jawab: C**

Explanation: The course separates agent-loop location from tool-execution location. A bridge is a dependency, not proof that the whole task is local.

Wazahat: Loop kahan chalta hai aur tool kahan — dono alag hain. Bridge aik dependency hai, is ka saboot nahi ke poora task local hai.

Q4. A new product advertises recurring runs, integrations, autopilot, workspace memory, approval controls, and a remote computer. Which six-part mapping is best?

Naya product recurring runs, integrations, autopilot, workspace memory, approval controls aur remote computer batata hai. Chhe hisson ki sahi mapping?

- A) Body, spine, gate, reach, heartbeat, loop
Body, spine, gate, reach, heartbeat, loop
- B) Gate, body, heartbeat, spine, reach, loop
Gate, body, heartbeat, spine, reach, loop
- C) All six labels describe different connector features
Sab connector features
- D) Heartbeat, reach, loop, spine, gate, body
Heartbeat, reach, loop, spine, gate, body

✓ **Correct answer / Sahi jawab: D**

Explanation: Recurring runs → heartbeat, integrations → reach, autopilot → loop, workspace memory → state spine, approval controls → human gate, remote computer → body.

Wazahat: Recurring runs = heartbeat, integrations = reach, autopilot = loop, workspace memory = spine, approval = gate, remote computer = body.

Q5. Ayesha can update the same CRM record through a structured connector or an authenticated browser. Why does 'same shape' not mean 'same trust'?

Ayesha aik hi CRM record connector ya signed-in browser se update kar sakti hai. 'Same shape' ka matlab 'same trust' kyun nahi?

- A) The paths can differ in permissions, visibility, and injection risk
Dono raaston ki ijazatein, nazar aana aur injection ka khatra mukhtalif ho sakta hai
- B) The connector must always use a weaker model than the browser path
Connector kamzor model use karta hai
- C) The browser cannot act once a business system requires a sign-in
Sign-in par browser kaam nahi karta
- D) The paths become equally safe once they produce the same final format
Aik jaisa format ho to barabar mehfooz

✓ **Correct answer / Sahi jawab: A**

Explanation: Both may reach the same system, but their controls and exposure differ. The lens tells you a component's role; you still inspect how the vendor built it.

Wazahat: Dono aik system tak pahunchte hain magar controls aur khatra mukhtalif. Lens kirdaar batata hai; vendor ne kaise banaya woh khud dekhein.

Q6. What is ChatGPT Work Plan mode an example of in this course's architecture?

Is course ke architecture mein ChatGPT Work ka Plan mode kis cheez ki misaal hai?

- A) A seventh harness part that sits between the loop and the human gate
Harness ka satwan hissa
- B) A built-in version of the brief, plan, approve, then execute discipline
Brief → plan → approve → execute discipline ka built-in roop
- C) A replacement for approval controls because planning removes action risk
Approval controls ka mutabadil
- D) A browser sign-in mode used to prepare authenticated website sessions
Browser sign-in mode

✓ **Correct answer / Sahi jawab: B**

Explanation: Plan mode gathers context, asks questions, creates a plan, and lets the user revise or approve it — the delegation discipline, not a new harness part.

Wazahat: Plan mode context jama karta, sawal poochta, plan banata aur user se manzoori leta hai — delegation discipline, naya hissa nahi.

Q7. Ayesha wants four kinds of continuity: a record of one run, a workspace for one client, a remembered preference across sessions, and a standing rule about tone. Which mapping is correct?

Ayesha ko chaar tarah ka tasalsul chahiye: aik run ka record, aik client ka workspace, sessions mein yaad rehne wali pasand, aur lehje ka mustaqil qaida. Sahi mapping?

- A) Semantic memory, session history, standing instructions, Project
Semantic memory, session history, standing instructions, Project
- B) Project, semantic memory, session history, temporary scratch space
Project, semantic memory, session history, scratch
- C) Session history, Project, semantic memory, standing instructions
Session history, Project, semantic memory, standing instructions
- D) Standing instructions, Project, session history, semantic memory
Standing instructions, Project, session history, semantic memory

✓ **Correct answer / Sahi jawab: C**

Explanation: The state spine is layered: session history, Projects, semantic memory, and standing instructions each hold a different kind of state.

Wazahat: State spine tehon wali hai: session history, Projects, semantic memory aur standing instructions — har aik alag qisam ki state.

Q8. Claude remembers a work preference across chat and cloud Cowork. What control does the August memory model give the user?

Claude chat aur cloud Cowork mein kaam ki pasand yaad rakhta hai. August memory model user ko kya ikhtiyar deta hai?

- A) It can only delete the entire account if a remembered fact is wrong
Sirf poora account delete
- B) It can inspect memories but cannot change or remove individual topics
Dekh sakte hain, badal nahi
- C) Only workspace administrators can see or revise remembered preferences
Sirf admin
- D) It can inspect, edit, or delete the memory topics that carry forward
Memory topics dekh, edit ya delete kar sakte hain

✓ **Correct answer / Sahi jawab: D**

Explanation: Current Claude memory can be inspected topic by topic and edited or deleted — a distinct, controllable layer.

Wazahat: Claude memory topic-wise dekhi, edit ya delete ki ja sakti hai — alag, qabil-e-control teh.

Q9. A task creates scratch calculations, a reusable template, and a final client report. Which tier should each use?

Aik task scratch hisaab, dobara use hone wala template aur final client report banata hai. Har aik kis tier mein?

- A) Scratch in tier 1, reusable template in tier 2, final report in tier 3
Scratch tier 1, template tier 2, final report tier 3
- B) Scratch in tier 2, reusable template in tier 3, final report in tier 1
Scratch 2, template 3, report 1
- C) All three in tier 2 because platform persistence is the safest default
Sab tier 2
- D) All three in tier 3 because every intermediate file should be archived
Sab tier 3

✓ **Correct answer / Sahi jawab: A**

Explanation: Tier 1 is temporary scratch, tier 2 is useful platform storage, tier 3 is the lasting system of record you control.

Wazahat: Tier 1 = aarzi scratch, tier 2 = platform storage, tier 3 = aapke qabze wala mustaqil record.

Q10. Why does the course insist that finished work exits to tier 3?

Course kyun kehta hai mukammal kaam tier 3 mein jaye?

- A) Because tier 3 is normally the cheapest place to store every output
Tier 3 sasta hai
- B) Because the authoritative record should live under your own custody
Mustanad record aapki apni tahweel mein hona chahiye
- C) Because files kept in tier 2 cannot be reopened from another device
Tier 2 files doosre device par nahi khultin
- D) Because vendor platforms cannot retain finished files after a session
Vendor files nahi rakhte

✓ **Correct answer / Sahi jawab: B**

Explanation: Vendor persistence is convenient for active work, but the authoritative deliverable belongs in your own controlled destination — custody and portability.

Wazahat: Vendor storage jaari kaam ke liye aasaan hai, magar asal deliverable aapki apni jagah (Drive, repo, folder) mein ho — qabza aur portability.

Q11. A workflow can use either a structured CRM connector or full computer use to update the same record. Which should you try first?

Workflow aik hi record structured CRM connector ya full computer use se update kar sakta hai. Pehle kaunsa?

- A) Use full computer control first because it most closely imitates a person
Pehle full computer control
- B) Use both paths together so each can verify every action taken by the other
Dono saath
- C) Use the connector first because its permissions and actions are clearer
Pehle connector — iski ijazatein aur actions zyada wazeh hain
- D) Use whichever path has the more familiar user interface for the operator
Jo interface maanoos ho

✓ **Correct answer / Sahi jawab: C**

Explanation: The reach ladder: connector before browser, browser before full computer use, when the narrower tool can finish the task.

Wazahat: Reach ladder: pehle connector, phir browser, phir full computer use — agar tang tool kaam kar sake.

Q12. Ayesha connects her mailbox so an agent can read and summarize threads. What should she assume about sending messages?

Ayesha mailbox jodti hai taake agent threads parh aur khulasa kar sake. Messages bhejne ke baare mein kya samjhe?

- A) Read permission normally includes send permission for the same mailbox
Read mein send shamil
- B) Sending becomes low-risk after the agent has summarized several threads
Kai khulase ke baad bhejna kam khatra
- C) Drafting is impossible unless the connector can also transmit messages
Draft namumkin
- D) Treat sending as a separate, higher-consequence permission to grant
Bhejna alag, zyada nateeje wali ijazat samjhein

✓ **Correct answer / Sahi jawab: D**

Explanation: Read is not send, draft is not publish, view is not edit. Grant the smallest scope that completes the workflow.

Wazahat: Read ≠ send, draft ≠ publish, view ≠ edit. Sab se chhoti ijazat dein jo kaam poora kare.

Q13. When should you prefer Claude's built-in Cowork browser over Claude in Chrome?

Claude in Chrome ki bajaye Cowork ka built-in browser kab behtar hai?

- A) For delegated website work that belongs in Claude's separate browser
Delegated website kaam ke liye jo Claude ke alag browser mein ho
- B) Only for public websites that never require a user to sign in or confirm
Sirf public websites
- C) When the task depends on tabs and sessions already open in your Chrome
Jab Chrome ke khule tabs chahiye
- D) Whenever you want Chrome and Cowork to share the same browser state
Jab Chrome aur Cowork state share karein

✓ **Correct answer / Sahi jawab: A**

Explanation: The built-in Cowork browser is Claude's separate browser for delegated web work. Claude in Chrome is better when the task needs your open Chrome sessions and accounts.

Wazahat: Cowork browser delegated web kaam ke liye Claude ka alag browser hai. Chrome ke khule sessions chahiye hon to Claude in Chrome.

Q14. A signed-in browser agent reads a hostile webpage that tells it to send data somewhere the user never asked for. What risk is this?

Signed-in browser agent aik dushman webpage parhta hai jo use data kahin aur bhejne ko kehta hai. Yeh kaunsa khatra hai?

- A) Semantic-memory drift caused by an old preference affecting a new task
Memory drift
- B) Prompt injection from untrusted page content redirecting the agent
Prompt injection — ghair-bharosemand page ka content agent ko ghalat raaste le jata hai
- C) A scheduler failure caused by the browser pausing on an unsupported page
Scheduler failure
- D) A formatting problem caused by the website presenting hidden page text
Formatting masla

✓ **Correct answer / Sahi jawab: B**

Explanation: Prompt injection matters most when an agent can both read untrusted content and act in a real account. Tighten the gate and reject actions you did not ask for.

Wazahat: Prompt injection tab sab se khatarnak jab agent ghair-bharosemand content parhe aur asal account mein amal bhi kar sake. Gate sakht karein, anmaange actions reject karein.

Q15. Which Cowork approval-mode description is correct?

Cowork approval modes ki kaunsi tareef sahi hai?

- A) Manual and Auto both ask for every action, while Skip only hides messages
Manual aur Auto dono har action poochte hain
- B) Skip adds the strongest action screening because it runs without a person
Skip sab se sakht screening
- C) Manual asks, Auto safety-checks, and Skip removes the ordinary action check
Manual poochta hai, Auto safety-check karta hai, Skip aam check hata deta hai
- D) Auto requires a user click for every action but groups the prompts together
Auto har action par click

✓ **Correct answer / Sahi jawab: C**

Explanation: Manual keeps the user closer to actions. Auto continues with automated action screening. Skip removes the ordinary approval pauses and the Auto action check.

Wazahat: Manual user ko qareeb rakhta hai; Auto khudkar screening ke saath chalta hai; Skip aam approval aur Auto check dono hata deta hai.

Q16. Ayesha opens the Cowork side panel for the first time and sees Automatically approve selected. What should she conclude?

Ayesha pehli baar Cowork side panel kholti hai aur 'Automatically approve' select dekhti hai. Kya nateeja nikale?

- A) It means Manual is unavailable because the account has been locked to Auto
Manual dastyab nahi
- B) It means Auto is always safer than Manual because a classifier is present
Auto hamesha zyada mehfooz
- C) It means Auto and Skip use the same checks but present different interfaces
Auto aur Skip aik jaise
- D) It is only the product default. Workflow risk should still choose the mode
Yeh sirf product default hai — mode workflow ke khatre se chunein

✓ **Correct answer / Sahi jawab: D**

Explanation: Product defaults and workflow policy are different questions. The course recommends Manual for unfamiliar or high-consequence work; Auto also uses more allowance.

Wazahat: Product default aur workflow policy alag sawal hain. Naye ya ahem kaam ke liye Manual behtar; Auto zyada allowance bhi kharch karta hai.

Q17. Before leaving a workflow unattended, Ayesha deliberately triggers one harmless approval and walks away. What is she testing?

Workflow akela chhodne se pehle Ayesha aik be-zarar approval trigger karke chali jati hai. Woh kya test kar rahi hai?

- A) Whether the gate reaches her and changes the run as expected
Kya gate us tak pahunchta hai aur run ko umeed ke mutabiq badalta hai
- B) Whether the model can make approval messages more detailed before sending
Model tafseeli messages bana sakta hai
- C) Whether every connector in the workspace can be approved with one decision
Sab connectors aik faislay se
- D) Whether the scheduler can repeat the approval test many times in one minute
Scheduler dohra sakta hai

✓ **Correct answer / Sahi jawab: A**

Explanation: A gate you have never tested is an assumption. Trigger one harmless approval, step away, confirm you receive it, then check approving or denying changes the run.

Wazahat: Jo gate test na hua woh sirf mafrooza hai. Aik be-zarar approval chalayein, door jayein, dekhein milti hai, phir approve/deny ka asar check karein.

Q18. Ayesha loses an hour every Monday to a workflow she dislikes, but she cannot yet describe the procedure cleanly. What should she do first?

Ayesha har Monday aik ghanta aise kaam mein lagati hai jo nahi and hai, magar tareeqa saaf bayan nahi kar sakti. Pehle kya kare?

- A) Write a detailed procedure immediately even if several steps are still guesses
Foran tafseeli tareeqa likhe
- B) Describe the frustration and let the agent interview her to map the workflow
Pareshani bataye aur agent use interview karke workflow ka naqsha banaye
- C) Schedule the work first so the agent can discover the workflow in production
Pehle schedule kare
- D) Grant every available tool first so permissions never interrupt discovery
Sab tools ki ijazat de

✓ **Correct answer / Sahi jawab: B**

Explanation: Workflow discovery can come before writing it down. Let the agent help uncover the real procedure, then turn it into a durable brief and test it before scheduling.

Wazahat: Workflow dhoondna likhne se pehle ho sakta hai. Agent asal tareeqa nikalne mein madad kare, phir pakka brief banayein aur schedule se pehle test karein.

Q19. Ayesha is writing a brief for a task she will not watch. Which instruction would weaken the brief rather than strengthen it?

Ayesha aise kaam ka brief likh rahi hai jo woh dekhegi nahi. Kaunsi hidayat brief ko kamzor karegi?

- A) Define the outcome, audience, and decision the deliverable should support
Outcome, audience aur faisla batana
- B) Name the permitted sources, boundaries, and actions that need escalation
Ijazat wale sources, hudood aur escalation
- C) Tell the agent to invent missing evidence instead of reporting the gap
Agent ko kehna ke ghaib saboot ghad le, kami na bataye
- D) Specify the destination and an observable definition of done for the output
Manzil aur 'done' ki wazeh tareef

✓ **Correct answer / Sahi jawab: C**

Explanation: If evidence is missing, the agent should name the gap and stop rather than invent it.

Wazahat: Saboot na ho to agent kami bataye aur ruke, ghade nahi.

Q20. Which four checks should you apply when reviewing an agent's plan?

Agent ka plan review karte waqt kaunse chaar checks?

- A) Model, color, font, length
Model, rang, font, lambai
- B) Speed, price, logo, browser
Raftaar, qeemat, logo, browser
- C) Only whether the plan sounds confident
Sirf pur-aitmaad lagna
- D) Scope, order, reach, assumptions
Scope, order, reach, assumptions

✓ **Correct answer / Sahi jawab: D**

Explanation: Scope, order, reach, and assumptions catch a grown job, acting before checking, unplanned send/write actions, and silent decisions — cheaper before execution.

Wazahat: Scope, order, reach, assumptions: barha hua kaam, check se pehle amal, anchahe send/write, aur khamosh faislay pakadte hain.

Q21. A Monday task runs in the cloud but needs a file that exists only on a sleeping laptop through a desktop bridge. Is the schedule truly device-independent?

Monday task cloud mein chalta hai magar aisi file chahiye jo sirf soye hue laptop par hai (desktop bridge se). Kya schedule device se azad hai?

- A) No, because one required tool still depends on the desktop staying online
Nahi — aik zaroori tool abhi bhi desktop ke online rehne par munhasir hai
- B) Yes, because a cloud heartbeat makes every local dependency irrelevant
Haan, cloud heartbeat kaafi
- C) Yes, because semantic memory automatically copies local files into the cloud
Haan, memory files copy kar deti
- D) No, because no scheduled task can ever be independent of a user device
Nahi, koi task kabhi azad nahi

✓ **Correct answer / Sahi jawab: A**

Explanation: A cloud heartbeat is only part of it. Every required source and tool must also be reachable without the user's device.

Wazahat: Cloud heartbeat sirf aik hissa hai. Har zaroori source aur tool user ke device ke baghair pahunch mein ho.

Q22. Why should a scheduled brief define the empty case explicitly?

Scheduled brief mein 'khaali' soorat saaf kyun likhein?

- A) Because an empty run is charged differently from a run that finds new items
Khaali run ka alag kharch
- B) Because a quiet result distinguishes no activity from silent failure
Khamosh nateeja 'kuch nahi hua' aur 'chupke se fail hua' mein farq karta hai
- C) Because a scheduled task is not allowed to return zero matching items
Zero items allowed nahi
- D) Because the agent should invent a placeholder when there is nothing to report
Placeholder ghade

✓ **Correct answer / Sahi jawab: B**

Explanation: An explicit 'no new items' result distinguishes a quiet period from a workflow that did not run, lost access, paused at a gate, or failed to deliver.

Wazahat: Saaf 'koi naya item nahi' khamosh hafte ko us workflow se alag karta hai jo chala nahi, access kho gaya, gate par ruka ya deliver nahi hua.

Q23. A recurring task shows 'completed'. What does the course still require before you call it successful?

Recurring task 'completed' dikhata hai. Kamyab kehne se pehle course aur kya maangta hai?

- A) A second vendor account confirming that the scheduler fired at the right time
Doosra vendor account
- B) A local runtime record proving that the task did not depend on a cloud service
Local runtime record
- C) An observable signal that the right output was produced and delivered
Nazar aane wala ishara ke sahi output bana aur pahuncha
- D) Nothing else, because completed status already proves the intended outcome
Kuch nahi

✓ **Correct answer / Sahi jawab: C**

Explanation: Ran is not the same as worked. Need an observable success signal: items processed, a dated file at the destination, or an explicit empty result.

Wazahat: Chalna aur kaam karna aik nahi. Nazar aane wala saboot chahiye: items process hue, sahi jagah dated file, ya saaf khaali nateeja.

Q24. Which scheduled workflow is the better beginner starting point?

Beginner ke liye kaunsa scheduled workflow behtar aaghaz hai?

- A) An unattended task that sends payment demands on its very first live run
Pehle run mein payment demands bhejna
- B) An unattended task that permanently deletes records it classifies as stale
Purane records hamesha ke liye delete
- C) A purchasing workflow that orders supplies whenever predicted demand rises
Supplies order karna
- D) A weekly report from approved sources that produces a reviewable brief
Approved sources se haftawar report jo review ho sake

✓ **Correct answer / Sahi jawab: D**

Explanation: Start with reporting, because the output stays reviewable and the blast radius is lower.

Wazahat: Reporting se shuru karein — output review ho sakta hai aur nuqsan ka daira kam hai.

Q25. A cloud session must keep working while you travel, but one step needs an approved local browser session while your desktop is online. Which runtime pattern is this?

Cloud session safar mein chalta rahe, magar aik step ko desktop online hone par local browser session chahiye. Yeh kaunsa pattern hai?

- A) A cloud loop with a desktop bridge for one required local browser capability
Cloud loop + aik local browser salahiyat ke liye desktop bridge
- B) A cloud-only session because the agent loop itself is running on vendor servers
Sirf cloud
- C) A pure local session because one browser tool is executing on the user's device
Sirf local
- D) An ordinary chat turn because the user must sometimes approve browser actions
Aam chat

✓ **Correct answer / Sahi jawab: A**

Explanation: The loop stays in the cloud, but one tool executes through the connected desktop — the hybrid pattern.

Wazahat: Loop cloud mein, aik tool desktop ke zariye — hybrid pattern.

Q26. A team sees enterprise compliance controls and wants to put PHI through Cowork immediately. What should happen next?

Team enterprise compliance controls dekh kar foran PHI (sehat data) Cowork se guzarna chahti hai. Agla qadam?

- A) Proceed because enterprise compliance controls automatically approve PHI use
Aage barhein, controls khud approve karte hain
- B) Verify the exact surface and contract because Cowork is not currently BAA-covered
Exact surface aur contract verify karein — Cowork abhi BAA ke daire mein nahi
- C) Proceed in Manual mode because per-action approval makes PHI processing compliant
Manual mode mein theek
- D) Keep only the source file local because that automatically makes processing local
Source file local rakhein

✓ **Correct answer / Sahi jawab: B**

Explanation: Product controls and audit visibility do not override what the contract allows. Compliance must match the exact surface and configuration.

Wazahat: Product controls contract ki ijazat se upar nahi. Compliance exact surface aur configuration se mele.

Q27. A team is choosing between a managed agent surface and an open path they would operate themselves. What is the central trade?

Team managed agent surface aur khud chalaye jane wale open path mein chun rahi hai. Markazi sauda kya hai?

- A) Open is always cheaper because it removes all managed-service operating costs
Open hamesha sasta
- B) Managed always keeps processing local, while open always sends work to the cloud
Managed hamesha local
- C) Managed gives a ready spine. Open gives more custody but more operations
Managed tayyar spine deta hai; open zyada qabza magar zyada operations
- D) Open removes the need for schedules, gates, observability, and failure recovery
Open mein schedules/gates ki zaroorat nahi

✓ **Correct answer / Sahi jawab: C**

Explanation: Managed products hand you the spine ready. The open path gives more custody and choice, but someone must build, operate, watch, and repair the infrastructure.

Wazahat: Managed tayyar spine deta hai. Open zyada qabza aur ikhtiyar deta hai, magar infrastructure banana, chalana aur theek karna aapka kaam.

Q28. Which set belongs to the lasting layer of this course rather than the fast-changing mechanical layer?

Kaunsa set course ki pai-daar teh ka hai, tezi se badalne wali mechanical teh ka nahi?

- A) Current button names, plan tiers, rollout dates, and temporary usage limits
Button naam, plans, dates, limits
- B) The exact August browser menu layout, permission labels, and connector catalog
August menu layout, labels, catalog
- C) Current product defaults, model names, browser availability, and plan packaging
Defaults, model naam, packaging
- D) Architecture, layered state, custody, gates, delegation, and success checks
Architecture, tehon wali state, custody, gates, delegation aur success checks

✓ **Correct answer / Sahi jawab: D**

Explanation: The lasting layer is the way of reasoning that transfers. Product names, defaults, limits, and menus are mechanical details to check.

Wazahat: Pai-daar teh soch ka tareeqa hai jo muntaqil hota hai. Naam, defaults, limits aur menus mechanical tafseelat hain.

Course 8: Workflow Design & Diagnosis

<https://agentfactory.panaversity.org/docs/workflow-design-diagnosis-crash-course>

Practice Test — 12 MCQs

Q1. A team's expense workflow has six steps. Step 3 totals the report and computes the amount over policy limits. How should that step be classified, and what should carry it?

Team ke expense workflow mein chhe steps hain. Step 3 report ka total aur policy limit se zyada raqam nikalta hai. Is step ki darja-bandi kya ho aur kaun kare?

- A) Human-retained, because a figure that decides how much somebody is reimbursed is consequential enough that a person should produce it themselves
Human-retained — raqam ahem hai, insaan khud banaye
- B) AI-appropriate because the total is reversible and gets checked at the approval step, carried by code execution because it is arithmetic
AI-appropriate — total wapas liya ja sakta hai aur approval par check hota hai; hisaab hai is liye code execution kare
- C) Collaborative, because AI can total the lines but a human ought to re-add them separately to confirm that the arithmetic came out right
Collaborative — insaan dobara jode
- D) AI-appropriate, carried by a Skill, because the policy limits are stable rules that belong in a repeatable configured procedure
AI-appropriate, Skill ke zariye

✓ **Correct answer / Sahi jawab: B**

Explanation: Two separate decisions. Ownership: the total is reversible and an error surfaces at approval, so it delegates. Being arithmetic decides only what carries it: code execution, not prose. A Skill carries procedure, not calculation.

Wazahat: Do alag faislay. Malikiyat: total wapas ho sakta hai aur ghalti approval par pakdi jati hai, is liye delegate. Hisaab hone se sirf yeh tay hota hai ke code execution kare. Skill tareeqa rakhti hai, hisaab nahi.

Q2. A proposal team has used AI to draft client responses for four months. The drafts are consistently strong, so the team lead proposes letting it send the low-value responses directly. Which mapping error is this, and why?

Proposal team chaar mahine se AI se client jawab draft karwa rahi hai; drafts achhe hain, to lead kam qeemat wale jawab seedha bhejne ki tajweez deta hai. Yeh kaunsi mapping ghalti hai?

- A) Mapping the tool instead of the work, because the workflow is being reshaped around a feature the team has grown comfortable with using
Kaam ki jagah tool ki mapping
- B) The unstaffed gate, because the review on those responses will stop being performed by anyone once the sending goes direct
Unstaffed gate
- C) Halo delegation, because sending is being judged by how well drafting went, and competence on one step is not evidence about another
Halo delegation — bhejne ko draft ki kamyabi se jaancha ja raha hai; aik step ki maharat doosre ka saboot nahi
- D) None of these, because four months of consistent quality is exactly the kind of evidence a delegation decision ought to rest on
Koi ghalti nahi

✓ **Correct answer / Sahi jawab: C**

Explanation: Sending is irreversible and external. Drafting quality says nothing about whether an unreviewed send is safe — credit carried forward. The unstaffed gate describes a gate decaying unnoticed; here the team is deciding openly.

Wazahat: Bhejna na-qabil-e-wapsi aur bahar jata hai. Draft ka achha hona yeh nahi batata ke bina review bhejna mehfooz hai — yeh halo hai. Unstaffed gate chupke se hota hai; yahan team khule aam faisla kar rahi hai.

Q3. You open a fresh chat and ask for a two-page summary of a supplier contract for your finance lead. The first answer is competent, generic, and never mentions the two payment terms she asked about. Nothing degraded over time. What does the timing tell you?

Aap nayi chat mein finance lead ke liye supplier contract ka do page khulasa maangte hain. Pehla jawab theek magar aam hai aur woh do payment terms nahi batata jo usne poochi thin. Waqt ke saath kuch nahi bigra. Timing kya batati hai?

- A) Under-specification, because the answer was wrong from the first response in a fresh session, so nothing had time to fill or drift
Under-specification — nayi chat mein pehla jawab hi ghalat tha, kuch bharne ya bigarne ka waqt nahi mila
- B) Context overload, because the assistant had been carrying too much from the surrounding workspace and had lost track of the important detail
Context overload
- C) Stale configuration, because a standing instruction covering contract summaries has drifted out of date without ever raising an error
Purani configuration
- D) Wrong model tier, because payment terms carry the kind of contractual nuance a model chosen for speed cannot reliably pick out
Ghalat model tier

✓ **Correct answer / Sahi jawab: A**

Explanation: The session was fresh and the first answer was already wrong. The prompt never carried the two terms that mattered. Overload and stale configuration both require change over time.

Wazahat: Session naya tha aur pehla jawab hi ghalat — prompt mein woh do terms the hi nahi. Overload aur purani configuration ke liye waqt guzarna zaroori hai.

Q4. You built a call checklist as an artifact for your own client onboarding calls. Six months on, three account managers read from it on every call and HR has linked it in the new-hire pack. What does this signal, and what does it call for?

Aapne apni onboarding calls ke liye checklist artifact banaya. Chhe mahine baad teen account managers har call par ise parhte hain aur HR ne new-hire pack mein link diya hai. Yeh kya ishara hai?

- A) That the method has stabilised, so the checklist is ready to be manufactured into a permanent worker running on a schedule
Tareeqa pakka ho gaya, worker banayein
- B) That the checklist should be rebuilt on a more capable model tier, because the accuracy bar rises with the size of the audience
Taaqatwar model par dobara
- C) That the checklist now needs a verification step, because material HR distributes to new hires requires a review gate that a personal tool does not
Verification step chahiye
- D) That other people now depend on it as infrastructure, so it has outgrown prompt-and-iterate and belongs with developer or architect expertise
Doosre log ab is par infrastructure ki tarah munhasir hain — yeh prompt-and-iterate se barh gaya, developer/architect ki maharat chahiye

✓ **Correct answer / Sahi jawab: D**

Explanation: Dependency by others is the escalation signal. Uptime, access, and someone to call when it breaks are not prompt-and-iterate problems. The 'method stabilised' signal points to manufacturing — a different test.

Wazahat: Doosron ka inhisaar escalation ka ishara hai. Uptime, access aur tootne par kise bulana — yeh prompt-and-iterate ke masail nahi. 'Tareeqa pakka' wala ishara manufacturing ki taraf hai, jo alag test hai.

Q5. An analyst types the same reminder into the chat every month, that the revenue report must exclude canceled orders. It works every month. He takes two weeks off, a colleague runs the report, and the canceled orders are in it. What failed?

Analyst har mahine chat mein yaad dihani likhta hai ke revenue report mein cancel orders shamil na hon. Chhutti par jata hai, saathi report chalata hai aur cancel orders shamil ho jate hain. Kya fail hua?

- A) The reminder was under-specified, because it never set out precisely which orders counted as canceled for reporting purposes
Reminder mubham tha
- B) The colleague did not read the handover notes, which would have described the monthly reporting procedure in enough detail
Saathi ne notes nahi parhe
- C) Nothing failed in the setup, because this is ordinary human error during a cover arrangement and a checklist is the right answer to it
Setup mein kuch nahi, insaani ghalti
- D) The fix was never promoted out of the conversation, so it existed for one person only and did not survive a change of operator
Hal kabhi chat se bahar promote nahi hua — sirf aik shakhs ke paas tha, operator badalne par khatam

✓ **Correct answer / Sahi jawab: D**

Explanation: The correct instruction was left in a chat, which made it personal. Promotion into a standing instruction would have made it apply for anyone running the Project.

Wazahat: Sahi hidayat chat mein reh gayi, is liye zaati thi. Standing instruction bana dete to jo bhi Project chalata us par lagu hoti.

Q6. Three coordinators each write a weekly client update. Each one's updates are internally consistent from week to week. The account director spends an hour every Monday rewriting all three into one voice before they go out. Which friction signal is this?

Teen coordinators haftawar client update likhte hain; har aik ka apna kaam yaksan hai. Account director har Monday aik ghanta teeno ko aik andaaz mein dobara likhta hai. Yeh kaunsa friction signal hai?

- A) Correction, and the fix is a standing instruction that stops the recurring flaw from turning up in any of the three updates
Correction, standing instruction
- B) Repetition, and the fix is saved context so that none of the three has to paste the same background material each week
Repetition, saved context
- C) Variance, and the fix is a shared Skill so all three produce one format, because the cost exists only between the people
Variance — shared Skill taake teeno aik format banayein; kharch sirf logon ke darmiyan hai
- D) None of these, because each update is acceptable on its own and pulling them into one voice is properly the director's job
Koi nahi

✓ **Correct answer / Sahi jawab: C**

Explanation: Variance is the signal nobody feels individually: each person's output is consistent, and the inconsistency appears only at the reviewer. A shared Skill removes it at the source.

Wazahat: Variance woh ishara hai jo kisi ko akele mehsoos nahi hota; farq sirf reviewer par nazar aata hai. Shared Skill ise jadd se khatam karti hai.

Q7. You are describing an AI-assisted contract workflow to a client's risk function. Which description earns the most trust?

Aap client ke risk department ko AI-assisted contract workflow bata rahe hain. Kaunsa bayan sab se zyada bharosa kamata hai?

- A) "Drafting is AI-assisted. A qualified lawyer reviews and approves every term, and nothing is sent without that sign-off."
'Drafting AI se hoti hai. Qualified wakeel har shart review aur approve karta hai, aur uske sign-off ke baghair kuch nahi jata.'
- B) "Our system reviews contracts automatically, which has cut turnaround time by roughly half against the manual process."
'Hamara system khud review karta hai, waqt aadha'
- C) "It pulls clauses, marks playbook departures with a configured Skill, drafts the redline, and computes exposure in code."
'Clauses nikalta, Skill se flag, redline, code mein exposure'
- D) "It is about as reliable as a junior associate on a first pass, which frees the senior people for higher-value work."
'Junior associate jitna bharosemand'

✓ **Correct answer / Sahi jawab: A**

Explanation: A risk function wants the control stated plainly, and the gate is the part that matters. 'Automatically' hides the gate; the mechanism version buries it; the junior-associate comparison sets a standard the tool will eventually miss.

Wazahat: Risk team control saaf sunna chahti hai — gate hi ahem hai. 'Automatically' gate chhupata hai; mechanism wala bayan use features mein dafna deta hai; junior associate ka muqabla aisa mayaar deta hai jo tool kabhi chook jayega.

Q8. Four requirements were extracted from a client brief. Which one would lead two teams to build different things?

Client brief se chaar requirements nikali gayin. Kaunsi do teams ko mukhtalif cheezein banwayegi?

- A) The monthly report must be delivered promptly once the accounting period has closed
Accounting period band hone ke baad monthly report 'jaldi' deliver ho
- B) The report must be available in both PDF and CSV, from the same underlying data
Report PDF aur CSV dono mein
- C) Each report must carry the reporting period and the date it was generated in its header
Header mein period aur tareekh
- D) Password-reset emails must reach the requesting user within five minutes of the request
Password-reset email paanch minute mein

✓ **Correct answer / Sahi jawab: A**

Explanation: 'Promptly' is not decidable: two days and two weeks are both prompt to somebody. The test for ambiguity is whether you can say what evidence would prove it met.

Wazahat: 'Jaldi' tay nahi ho sakta — do din aur do hafte dono kisi ke liye jaldi hain. Mubham requirement ka test: kya aap bata sakte hain kaunsa saboot ise poora sabit karega?

Q9. A team's map lists 'AI drafts, a manager reviews' for customer refund approvals. Six weeks in, the drafts have been reliable and the manager now approves the queue in a single batch each Friday without opening individual cases. What is the state of that step?

Map par refund approvals ke liye 'AI draft kare, manager review kare' likha hai. Chhe hafte baad manager har Friday poori queue bina cases khole aik saath approve karta hai. Is step ki haalat kya hai?

- A) Collaborative, as designed, because the manager still formally approves each refund and keeps the accountability for it
Collaborative, design ke mutabiq
- B) Automated in practice, because a collaborative step with no real reviewer is an automated step whatever the map records
Amalan automated — asli reviewer ke baghair collaborative step automated hi hai, map kuch bhi kahe
- C) Human-retained, because the batch approval is the accountability moment and the drafting is only a preparatory input
Human-retained
- D) Correctly optimised, because batching the review is the kind of friction removal a workflow audit is supposed to find
Sahi optimize hua

✓ **Correct answer / Sahi jawab: B**

Explanation: The gate is on the map and nobody is standing at it — the unstaffed gate. The map records what was designed, not what is running. Batching here removes the control itself.

Wazahat: Gate map par hai magar us par koi khara nahi — unstaffed gate. Map design dikhata hai, jo chal raha hai woh nahi. Batching ne control hi hata diya.

Q10. An output disappoints. Your first instinct is to switch to the most capable model available. What does the diagnostic sequence say about that instinct?

Output mayoos karta hai. Pehla khayal: sab se taaqatwar model par chale jayein. Diagnostic sequence kya kehti hai?

- A) It is reasonable as an opening move, because a more capable model resolves several of the four causes at once for little extra cost
Achha pehla qadam
- B) It is correct only when the output was wrong from the very first response, which is the signature of a task that exceeds the model tier
Sirf jab pehla jawab ghalat ho
- C) It is the right instinct in the wrong order, and it belongs immediately after checking whether the configuration has drifted out of date
Sahi khayal, ghalat tarteeb
- D) It is a move from the bottom of the ladder, made before re-reading the prompt or checking context length, and it is usually unnecessary
Yeh seedhi ke neeche wala qadam hai — prompt dobara parhne aur context length check karne se pehle — aur aksar ghair-zaroori

✓ **Correct answer / Sahi jawab: D**

Explanation: Cheapest first: prompt, context length, feature and model, configuration, then task fit. Re-reading the prompt resolves the most common cause in seconds.

Wazahat: Sab se sasta pehle: prompt, context length, feature/model, configuration, phir task fit. Prompt dobara parhna sab se aam wajah seconds mein hal karta hai.

Q11. In the contract map, 'flag departures from the playbook' is AI-appropriate. In an expense workflow, 'check each expense against the travel policy' comes out collaborative. Same kind of step, different column. What decides it?

Contract map mein 'playbook se hatne wali baatein flag karo' AI-appropriate hai; expense mein 'har kharch travel policy se check karo' collaborative. Aik jaisa step, alag column. Faisla kaun karta hai?

- A) The contract playbook is a written document while a travel policy relies on judgement, so only one of the two can be checked mechanically against a rule
Playbook likha hua, policy raaye par
- B) Whether anybody reads the flags at the next step, because a wrong flag that surfaces as a wrong redline is one that gets caught early
Kya agle step par koi flags parhta hai — ghalat flag ghalat redline ban kar jaldi pakda jata hai
- C) Contract work carries higher stakes than expense work, so the contract step needs the tighter of the two classifications
Contract ka khatra zyada
- D) Whether the team has built a Skill that already holds the rules, since a configured Skill is what makes a checking step safe to delegate
Kya Skill bani hui hai

✓ **Correct answer / Sahi jawab: B**

Explanation: The step did not change; what changed is whether anybody stands after it. In contract review the flags land in front of a human at the next row; in the expense workflow nothing downstream re-reads them.

Wazahat: Step wahi hai; farq yeh hai ke uske baad koi khara hai ya nahi. Contract mein agle row par insaan flags dekhta hai; expense mein koi nahi.

Q12. A coordinator drafts the shortlist of suppliers that a procurement manager then reviews, line by line, before any supplier is contacted. Someone argues the drafting must stay human because the manager is accountable for the choice. Is that right?

Coordinator suppliers ki shortlist draft karta hai jise procurement manager line-ba-line review karti hai, kisi supplier se rabte se pehle. Koi kehta hai drafting insaan kare kyunke manager zimmedar hai. Kya yeh sahi hai?

- A) Yes, because accountability sits with the manager, and any step that feeds into a decision she answers for has to be performed by a person
Haan, manager zimmedar hai
- B) Yes, because supplier selection is high-stakes work and high stakes rule out delegating any part of the process to an assistant
Haan, ahem kaam delegate nahi hota
- C) No, because accountability lives at the step that is the decision, and the drafting produces an input she judges before anything happens
Nahi — zimmedari us step par hai jo faisla hai; drafting sirf input hai jise woh pehle jaanchti hai
- D) No, because accountability was transferred to the tool the moment the shortlist was drafted by it rather than by the coordinator
Nahi, zimmedari tool ko chali gayi

✓ **Correct answer / Sahi jawab: C**

Explanation: Somebody answers for every step, so 'she is accountable' cannot decide a classification. The shortlist is an input she judges line by line, so drafting delegates and accountability stays at the review. Accountability never moves onto the machine.

Wazahat: Har step ka koi zimmedar hota hai. Shortlist input hai jise woh jaanchti hai — drafting delegate, zimmedari review par. Zimmedari kabhi machine par nahi jati.

Course 9: Governance, Risk & Responsible Use

<https://agentfactory.panaversity.org/docs/governance-risk-responsible-use-crash-course>

Practice Test — 21 MCQs

Q1. A team wants Claude to produce final, unreviewed determinations on benefits eligibility. How should this use case be classified, and on what grounds?

Team chahti hai Claude benefits eligibility par aakhri, bina review faislay de. Is use case ki darja-bandi kya ho aur kis bunyaad par?

- A) Appropriate with light human review, since a reviewer skimming the determinations restores enough oversight to make the workflow safe
Halke review ke saath munasib
- B) Fully appropriate, because the eligibility rules are written down and the model can apply written rules consistently across every case
Poori tarah munasib, qawaid likhe hue hain
- C) Inappropriate: the consequence is irreversible for the applicant and the professional accountability for a determination cannot transfer to a tool
Na-munasib — nateeja applicant ke liye na-qabil-e-wapsi hai aur faislay ki professional zimmedari tool ko muntaqil nahi ho sakti
- D) Appropriate if a more capable model is used, since the concern here is accuracy and a stronger model measurably reduces the error rate on tasks that apply written rules
Behtar model ho to munasib

✓ **Correct answer / Sahi jawab: C**

Explanation: Two criteria are load-bearing: a wrong determination lands on someone who may not know they can contest it, and accountability cannot be held by a tool. Neither is a capability problem, so a better model changes nothing. 'Light human review' is an undefined gate.

Wazahat: Do kasautiyan faisla kun hain: ghalat faisla aise shakhs par girta hai jo shayad challenge karna na jaane, aur zimmedari tool nahi utha sakti. Yeh salahiyat ka masla nahi, is liye behtar model se farq nahi. 'Halka review' ghair-wazeh gate hai.

Q2. A project brief says a shortlisting workflow is 'appropriate with human review.' Six weeks in, nobody has reviewed anything. What went wrong?

Project brief kehta hai shortlisting workflow 'human review ke saath munasib' hai. Chhe hafte baad kisi ne kuch review nahi kiya. Kya ghalat hua?

- A) The classification was too cautious, and a workflow this routine should have been classified fully appropriate from the start
Darja-bandi zyada ehtiyaati thi
- B) The gate was never defined, no role, no specific check, no point in the workflow, so the label was recorded but no control was ever created
Gate kabhi define hi nahi hua — na role, na khaas check, na workflow mein jagah; label likha gaya magar control bana hi nahi
- C) The team should have escalated the classification to a compliance function instead of making the call themselves at project level
Compliance ko escalate karna tha
- D) Human review is unworkable at the volume this team is actually handling, so the correct response is to remove the review requirement from the brief and formally record the residual risk instead
Review hata dein

✓ **Correct answer / Sahi jawab: B**

Explanation: 'Appropriate with human review' is a label; the gate is the control. A gate needs a named role, a specific risk to check, and a point before the output is used.

Wazahat: 'Human review ke saath munasib' sirf label hai; gate asal control hai. Gate ke liye naamzad role, khaas khatra jise check karna hai, aur output use hone se pehle ki jagah chahiye.

Q3. Drafting a condolence note to a client is fully reversible, costs nothing if it is wrong, and carries no regulatory weight. The course still says a person should own it. Why does that not contradict the screening criteria?

Client ko taziyati note likhna poori tarah wapas liya ja sakta hai, ghalat ho to nuqsan nahi, aur regulatory wazan nahi. Phir bhi course kehta hai insaan likhe. Yeh screening criteria se kyun nahi takrata?

A) Because reversibility only counts while the output stays internal, and anything that reaches a client is treated as irreversible by default whatever the subject matter happens to be

Client tak jane wali har cheez na-qabil-e-wapsi

B) Because the criteria are a checklist where any single failure ends the discussion, so one failed criterion rules the use case out

Checklist hai, aik fail to sab khatam

C) Because the criteria interact, and the human-element criterion can be load-bearing on its own even when the other three point the other way

Criteria aapas mein asar karte hain — insaani pehlu akela bhi faisla kun ho sakta hai chahe baqi teen doosri taraf hon

D) Because low-consequence tasks are exempt from screening, so the decision rests on personal preference rather than on the framework

Kam ahem kaam screening se azad

✓ **Correct answer / Sahi jawab: C**

Explanation: The criteria are not a scorecard where three out of four wins. They interact, and one is usually load-bearing — here the relationship element carries the whole decision.

Wazahat: *Criteria score card nahi ke chaar mein teen jeet jayein. Yeh aapas mein judte hain; yahan rishte ka pehlu poori faisla uthata hai.*

Q4. A financial summary that feeds a real decision is high-consequence. The course says it can still be appropriate. What makes the difference?

Asal faislay mein kaam aane wali financial summary ahem nataij wali hai. Course kehta hai phir bhi munasib ho sakti hai. Farq kya daalta hai?

A) A named reviewer signing off before the summary is used, which restores both reversibility and accountability to the workflow

Summary use hone se pehle naamzad reviewer ka sign-off — is se wapsi aur zimmedari dono bahaal

B) Running the analysis in the code execution sandbox, so the figures are computed in an isolated environment rather than generated

Code sandbox

C) Classifying it as inappropriate and having a human produce the summary, since high consequence is disqualifying on its own

Na-munasib qarar dein

D) Documenting that the team accepted the risk, so responsibility for any error is explicitly recorded in advance

Risk qubool karne ka record

✓ **Correct answer / Sahi jawab: A**

Explanation: High consequence raises the bar; it does not rule a use case out. A named reviewer means a wrong figure gets caught (reversibility) and a person is answerable (accountability). Recording accepted risk is a note, not a control.

Wazahat: *Ahem nateeja mayaar oonchaa karta hai, bahar nahi karta. Naamzad reviewer ghalat figure pakadta hai (wapsi) aur zimmedar hota hai (accountability). Risk likh dena control nahi, sirf note hai.*

Q5. An analyst has a spreadsheet of customer names and account numbers. The task is to find spending trends across the customer base. Company policy restricts regulated personal data. What is the right action?

Analyst ke paas customer naam aur account numbers wali spreadsheet hai; kaam kharch ke rujhanaat dhoondna hai. Policy regulated zaati data par pabandi lagati hai. Sahi qadam?

- A) Upload it as-is, since the analysis is internal and the data never leaves the company's own systems
Jaisa hai upload
- B) Skip the analysis, because regulated personal data should not go near the tool without written compliance approval
Analysis chhod dein
- C) Upload it in an incognito chat, so the file does not enter Memory or chat history and the policy control is satisfied
Incognito mein upload
- D) Replace the identifiers with Customer 1, Customer 2 and so on, then run the analysis on the anonymised version
Shanakhtein hata kar Customer 1, Customer 2 likhein, phir gumnaam version par analysis

✓ **Correct answer / Sahi jawab: D**

Explanation: Spending trends need the pattern, not the people. Once identifiers are gone, the analysis is not touching regulated data. Incognito governs remembering, not whether it was allowed in.

Wazahat: Rujhanaat ke liye pattern chahiye, log nahi. Shanakht hatne ke baad regulated data hi nahi raha. Incognito yaad rakhne ka maamla hai, ijazat ka nahi.

Q6. A clinician needs a summary of actual patient records, where the individual records are the substance of the task. Redaction would make the summary useless. What comes first?

Clinician ko asal patient records ka khulasa chahiye jahan records hi kaam ki jaan hain; redaction se khulasa bekaar. Pehle kya?

- A) Turning on Incognito mode, since the sensitivity of the data is exactly what incognito chats were designed to handle
Incognito on karein
- B) Establishing whether this entry point is approved for protected health information at all, which is settled by the admin in advance
Pehle yeh tay karein ke kya yeh entry point PHI ke liye approved hai — admin pehle se tay karta hai
- C) Redacting as much of the record as possible anyway and accepting a degraded summary, on the grounds that partial protection of the patients involved is better than no protection at all
Jitna ho sake redact karein
- D) Checking whether Memory is enabled on the plan, and proceeding if it is off so nothing persists across sessions
Memory band ho to aage barhein

✓ **Correct answer / Sahi jawab: B**

Explanation: Redaction is unavailable, so the prior question is unavoidable: is this data allowed here? That is answered by an admin in advance. Persistence controls answer a different question.

Wazahat: Redaction mumkin nahi, to pehla sawal: kya yeh data yahan allowed hai? Iska jawab admin pehle se deta hai. Persistence controls alag sawal ka jawab hain.

Q7. Someone uploads confidential deal documents in an incognito chat on a Team plan and reports that the material is now safe. What is wrong with that conclusion?

Koi Team plan par incognito chat mein khufiya deal documents upload karke kehta hai ab mehfooz hai. Is nateeje mein kya ghalat hai?

- A) Nothing is wrong: incognito chats are excluded from Memory and history, which is precisely the protection confidential material requires
Kuch ghalat nahi
- B) Incognito applies only to individual plans, so on a Team plan the ghost icon has no practical effect at all and the chat simply behaves like any ordinary one would
Incognito Team plan par kaam nahi karta
- C) Incognito is not deletion, on Team and Enterprise plans those chats still follow organizational retention and appear in standard data exports
Incognito deletion nahi — Team/Enterprise par yeh chats idare ki retention policy follow karti hain aur data exports mein aati hain
- D) Confidential material is a red-tier item, and red-tier data is never permitted in any entry point under any organizational configuration
Confidential red tier hai, kabhi allowed nahi

✓ **Correct answer / Sahi jawab: C**

Explanation: Incognito: no memories, not in history, not used for training — but not erasure. On Team and Enterprise, chats follow organizational retention and appear in exports.

Wazahat: Incognito: memory nahi, history nahi, training nahi — magar mitana nahi. Team/Enterprise par idare ki retention aur exports lagu hote hain.

Q8. A team is told to sort their material into green, yellow, and red tiers. One item is a draft pricing sheet for a product that has not been announced, and two people disagree about the tier. What does the course say to do?

Team ko material green, yellow, red tiers mein baantna hai. Aik gair-elaan shuda product ki pricing sheet par do log tier mein ikhtilaf karte hain. Course kya kehta hai?

- A) Treat it as the more sensitive of the two tiers until someone can confirm otherwise, because the cost of being wrong is asymmetric
Tasdeeq tak zyada hassas tier maanein — ghalti ka nuqsan barabar nahi
- B) Default to the lower of the two tiers, since over-classification creates friction, and friction is precisely what drives people towards unapproved tools in the first place
Neecha tier
- C) Escalate every disputed item to the compliance function, so that tier assignments are made consistently by a single authority
Har ikhtilaf compliance ko
- D) Split the difference by uploading it with an instruction telling Claude not to retain or reference the pricing figures
Upload karke kahein yaad na rakhe

✓ **Correct answer / Sahi jawab: A**

Explanation: Round up, not down: one tier too careful costs a two-minute confirmation; one tier too casual can cost the program.

Wazahat: Upar ki taraf gol karein: zyada ehtiyaat ka kharch do minute, kam ehtiyaat ka poora program.

Q9. A colleague shares a Skill from a public forum that converts meeting notes into summaries. Nothing in its bundled instructions limits it to meeting notes. What is the right action?

Saathi public forum se aik Skill share karta hai jo meeting notes ka khulasa banati hai. Iski hidayaat ise sirf notes tak mehdood nahi karti. Sahi qadam?

- A) Enable it, because a Skill runs only with the access its own task requires, and summarizing notes needs very little
Enable karein, Skill sirf zaroori access leti hai
- B) Enable it and watch its behavior closely for the first week, so that any problem it causes is caught early through direct observation rather than through assumptions about an unfamiliar publisher
Enable karke hafta bhar dekhein
- C) Evaluate the source and what it could reach in your sessions. The publisher is unknown and it inherits full session access, so escalate rather than enable
Source aur session mein iski pahunch jaanchein — publisher na-maloom hai aur yeh poora session access leti hai, is liye enable ki bajaye escalate
- D) Enable it, since a colleague has recommended it and a personal recommendation establishes the source adequately for a low-risk task
Saathi ki sifarish kaafi

✓ **Correct answer / Sahi jawab: C**

Explanation: A Skill is software; a colleague's recommendation is warmth, not vetting. A Skill has no permission manifest — it runs with whatever access the session has. Monitoring afterwards grants access before the risk is understood.

Wazahat: Skill software hai; saathi ki sifarish jaanch nahi. Skill ka koi permission manifest nahi — session ka sara access leti hai. Baad mein nigrani ka matlab khatra samajhne se pehle access de dena.

Q10. Someone who has learned to start connectors read-only applies the same reasoning to Skills. What is the error?

Jo connectors read-only se shuru karna seekh chuka hai, wahi soch Skills par lagata hai. Ghalti kya hai?

- A) There is no error: least privilege applies identically to both, and starting narrow is correct in either case
Koi galti nahi
- B) Connectors have scopes you grant and can narrow. A Skill has no scope dial and inherits the session's access, so the question changes from what am I granting to what can this reach
Connectors ke scopes hote hain jo tang kiye ja sakte hain; Skill ka koi scope dial nahi, session ka access leti hai — sawal 'main kya de raha hoon' se 'yeh kahan tak pahunch sakti hai' ban jata hai
- C) The error is reversed. Skills expose finer-grained permissions than connectors do, so applying connector-level caution to a Skill is unnecessarily restrictive and slows down work that whoever published the Skill had already scoped tightly in the first place
Uta hai, Skills zyada bareek
- D) Connector scopes are a developer-only feature, so the read-only guidance does not apply to anyone working in the chat interface
Scopes sirf developers ke liye

✓ **Correct answer / Sahi jawab: B**

Explanation: Least privilege needs a dial; connectors have one, Skills do not. For a Skill, ask what it could touch in your sessions and whether that is proportional.

Wazahat: Least privilege ke liye dial chahiye; connector ke paas hai, Skill ke paas nahi. Skill ke liye poochein: session mein yeh kya chhoo sakti hai aur kya yeh munasib hai.

Q11. A Skill built by another team inside the same company is offered to your team. Why does the course single this out as the hardest source case?

Company ki doosri team ki banai Skill aapki team ko di jati hai. Course ise sab se mushkil source case kyun kehta hai?

- A) Because internal software is exempt from vetting requirements, so no trust check applies and the decision falls to individual preference
Andaruni software jaanch se azad
- B) Because internal Skills are usually built by non-specialists and are therefore more likely to contain outright errors than third-party ones
Ghair-maahir banate hain
- C) Because 'internal' feels vetted without being vetted: it may carry broad reach granted for another team's convenience, or assumptions built against an older policy
'Andaruni' jaancha hua lagta hai magar hota nahi — doosri team ki suhulat ke liye wasee pahunch ya purani policy ke mafroozay ho sakte hain
- D) Because sharing Skills between teams is generally prohibited under most internal software policies, and the correct answer is therefore to decline the offer and build your own version of it from scratch instead
Teams mein sharing mana

✓ **Correct answer / Sahi jawab: C**

Explanation: The difficulty is social: a colleague's tool does not announce itself as needing scrutiny, so the check gets skipped where it feels unnecessary.

Wazahat: *Mushkil samaji hai: saathi ka tool jaanch ka taqaza nahi karta lagta, is liye wahi check chhoot jata hai.*

Q12. A hiring coordinator uses Claude to screen résumés into a shortlist and forwards it as 'the candidates who qualified.' The manager interviews only those candidates. Which concern does this most directly raise?

Hiring coordinator Claude se résumés screen karwa kar shortlist 'qualified candidates' ke naam se bhejta hai; manager sirf unhi ka interview leta hai. Sab se seedha kaunsa khadsha hai?

- A) Disclosure, since the applicants were never informed that an automated system was involved in evaluating their applications
Disclosure
- B) Accountability transfer, since responsibility for the hiring decision has in practice moved away from the coordinator and onto the tool that actually produced the shortlist of qualifying candidates
Zimmedari ka tool par muntaqil hona
- C) Consistency, since a model may rank the same résumé differently on different runs and the shortlist is therefore not reproducible
Consistency
- D) Bias: an automated screen removed people with no human review of the exclusions, so a systematic disadvantage to some group could go undetected indefinitely
Bias — automated screen ne logon ko nikala aur nikale gayon ka koi insaani review nahi, is liye kisi group ke saath mustaqil na-insaafi chhupi reh sakti hai

✓ **Correct answer / Sahi jawab: D**

Explanation: Only the survivors are looked at, so if the screen disadvantages a group, the only people positioned to notice are those filtered out. Accountability transfer is impossible — it never moves to a tool.

Wazahat: *Sirf bache hue dekhe jate hain; agar screen kisi group ke khilaf ho to notice karne wale wahi hain jo nikal diye gaye. Zimmedari tool par muntaqil ho hi nahi sakti.*

Q13. A manager faces a truly ambiguous disclosure question affecting several hundred employees, and no policy settles it. What does the course recommend?

Manager ke saamne saikdon mulazimeen par asar dalne wala waqai mubham disclosure sawal hai aur koi policy hal nahi karti. Course kya kehta hai?

- A) Decide it herself using the four questions and document the reasoning carefully, since documented individual judgment is the professional standard in every truly ambiguous case of this kind
Khud faisla karke likh le
- B) Escalate to the governance function with the framework applied and the specific unresolved point named, rather than arriving with a verdict to be confirmed
Governance ko escalate kare — framework laga kar aur khaas hal na hone wala nukta bata kar, na ke faisla le kar tasdeeq ke liye
- C) Default to disclosure without further analysis, since disclosing is always the safer option when a question cannot be resolved by policy
Bina soche disclose
- D) Postpone the decision until the policy is updated to cover the case, since acting without a governing rule creates unnecessary exposure
Policy tak intezar

✓ **Correct answer / Sahi jawab: B**

Explanation: A large affected population is a signal not to handle it alone. Bring the framework, where it ran out, and the specific unresolved issue — not 'I think this is fine, can you confirm'.

Wazahat: Zyada log mutasir hon to akele faisla na karein. Framework, woh jagah jahan woh khatam hua, aur khaas unsuljha nukta le kar jayein — 'mere khayal mein theek hai, confirm karo' nahi.

Q14. A quarterly review finds several team members pasting draft client deliverables into personal Claude accounts because the approved workspace is slower to log into. What does this most accurately represent?

Quarterly review mein pata chalta hai kai log client deliverables ke drafts zaati Claude accounts mein paste karte hain kyunke approved workspace mein login dheema hai. Yeh kya hai?

- A) An acceptable workaround, since the material involved is draft deliverables rather than final signed-off documents, and the work reaches the client considerably faster than it otherwise would have done
Qabil-e-qubool hai
- B) A Diligence gap between policy and practice, where friction in the approved path is driving people to an unapproved one and the fix is to remove that friction
Policy aur amal mein Diligence gap — approved raaste ki rukawat logon ko ghair-approved raaste par dhakelti hai; hal rukawat hatana hai
- C) Grounds for withdrawing Claude access from the team, since the pattern shows the tool cannot be used responsibly in this environment
Access wapas lein
- D) A performance issue for the individuals who took the shortcut, to be handled through the normal management process with those people
Afraad ki performance ka masla

✓ **Correct answer / Sahi jawab: B**

Explanation: When a compliant path is harder than a non-compliant one, people take the easy one. Make the approved route the easiest. Banning produces more shadow usage.

Wazahat: Jab jaiz raasta mushkil ho to log aasaan raasta lete hain. Approved raasta sab se aasaan banayein. Pabandi se chhupa istemal barhta hai.

Q15. A team lead's usage audit turns up three findings: an unreleased spec sent to a non-approved entry point, a Skill enabled with no source check, and a review gate skipped twice under deadline. What is the significant thing about these findings?

Team lead ke audit mein teen baatein: ghair-jaari spec ghair-approved jagah bheja gaya, bina source check Skill enable hui, aur deadline par review gate do baar chhoota. Ahem baat kya hai?

- A) None was malicious. All three are drift on routine decisions, and all three have habit-level fixes that make the compliant action the default
Koi bad-niyati nahi — teeno roz ke faislon mein drift hain, aur teeno ka hal aadat ke level par hai jo jaiz amal ko default bana de
- B) All three were deliberate policy violations, so the appropriate response is disciplinary and the underlying processes do not need changing
Jaan boojh kar khilaf warzi
- C) The findings are too minor to act on individually, and an audit is only worth running when a specific incident has already occurred
Bohat chhoti baatein
- D) The pattern shows the policy is simply too strict for the team's actual work, so the correct response is to relax the particular requirements that were being breached here
Policy bohat sakht hai

✓ **Correct answer / Sahi jawab: A**

Explanation: Each call was defensible in the moment — that is what drift looks like. The fixes: a reminder on entry points, vetting built into Project setup, and a non-negotiable review gate.

Wazahat: Har faisla us waqt jaiz lagta tha — drift aisa hi hota hai. Hal: entry points ki yaad dihani, Project setup mein jaanch, aur review gate lazmi.

Q16. Why does the course argue that governance habits must be fast, rather than thorough?

Course kyun kehta hai governance aadatein tez hon, lambi chauri nahi?

- A) Because a habit that costs ten minutes gets skipped on busy days, and busy days are exactly when the routine decisions that accumulate into drift get made
Das minute wali aadat masroof din chhoot jati hai — aur masroof din hi woh roz ke faislay hote hain jo drift banate hain
- B) Because thoroughness is unnecessary at the associate level, where decisions are routine and the consequential calls are made further up
Associate level par zaroorat nahi
- C) Because speed is what distinguishes governance from compliance as a discipline, and the compliance function exists to handle anything at all that truly requires slow and careful analysis
Raftaar governance ko compliance se alag karti hai
- D) Because the four questions produce identical answers regardless of how much time is spent on them, so additional deliberation adds nothing
Chaar sawal hamesha aik jawab

✓ **Correct answer / Sahi jawab: A**

Explanation: High-stakes decisions take care of themselves because people slow down. Risk accumulates on routine calls under time pressure, so the checklist runs in under a minute.

Wazahat: Bade faislon par log khud ruk jate hain. Khatra roz ke jaldi wale faislon par jama hota hai, is liye checklist aik minute se kam ki hai.

Q17. A team enables an Anthropic-published research Skill that fetches and summarises web pages, and connects it to a mailbox so it can send the summaries out. The source check passed cleanly. What risk remains?

Team Anthropic ki research Skill enable karti hai jo web pages la kar khulasa karti hai, aur use mailbox se jodti hai taake khulase bheje. Source check saaf pass hua. Kaunsa khatra baqi hai?

A) The Skill reads pages written by strangers, and instructions inside that content can steer a trusted tool that has been given the ability to send

Skill ajnabiyon ke likhe pages parhti hai; unke andar ki hidayaat aise bharosemand tool ko mod sakti hain jise bhejne ki taaqat di gayi hai

B) None that matters here: the publisher is trusted, and the source check is the control that governs what a Skill is permitted to go and do inside a session

Koi nahi

C) The summaries may contain factual errors, so the residual risk is accuracy and the fix is a verification step on each summary before it goes out

Factual ghaltiyan

D) Web pages are copyrighted, so summarising and redistributing them creates a rights problem that the source check was never designed to catch

Copyright

✓ **Correct answer / Sahi jawab: A**

Explanation: The source check answers who wrote the tool, not who wrote the content it reads. That is prompt injection, hardest when the workflow can act. Break up reading untrusted content + ability to act.

Wazahat: Source check batata hai tool kisne likha, content kisne nahi. Yeh prompt injection hai — sab se khatarnak jab workflow amal kar sake. Ghair-bharosemand parhna + amal ki taaqat ki jodi todein.

Q18. Twenty minutes ago you uploaded a client file containing personal data to a route your company has not approved. Nothing has been sent to anyone. What is the right first move?

Bees minute pehle aapne zaati data wali client file ghair-approved raaste par upload ki. Kisi ko kuch nahi bheja gaya. Pehla sahi qadam?

A) Delete the chat, since removing it limits how long the data is retained and nothing was forwarded to anyone else

Chat delete karein

B) Wait until you understand the exposure properly, so that when you do report it you can present a complete and accurate picture rather than a partial one

Poori tasveer samajhne tak intezaar

C) Run the same analysis again on a redacted version in an approved route, so the compliant version is the one on record

Redacted version dobara chalayein

D) Stop, write down what went in and when, and tell your manager or admin today, then ask what to do rather than deciding yourself

Rukein, likhein kya aur kab gaya, aaj hi manager/admin ko batayein, phir khud faisla karne ki bajaye poochein

✓ **Correct answer / Sahi jawab: D**

Explanation: Deleting removes your visibility without removing the data, and turns a mistake into concealment. Waiting wastes time that may be a legal deadline. Facts, quickly, to a named person.

Wazahat: Delete karne se data nahi mitta, sirf aapki nazar hat jati hai, aur ghalti chhupana ban jati hai. Intezaar qanooni muddat kha sakta hai. Facts, jaldi, naamzad shakhs ko.

Q19. Someone points out that their organization has no AI policy at all, so the course's repeated instruction to check against policy is meaningless for them. What does the course say?

Koi kehta hai uske idare ki koi AI policy nahi, is liye 'policy se check karo' bekaar hai. Course kya kehta hai?

- A) Wait for a policy before running work data through AI, since acting without a governing rule creates exposure the individual would personally carry
Policy ka intezar
- B) The four questions cannot be applied without a policy, so the practical move is to escalate every decision to a manager until one exists
Har faisla manager ko
- C) Adopt a published external governance framework wholesale and apply it exactly as written, since a recognized standard is far more defensible in a later review than anything a team writes internally in a single afternoon
Bahar ka framework jaisa hai apna lein
- D) Two things change: your written reasoning has to carry the weight the policy would have, and your defaults become the de facto policy, so make them explicit on one page
Do cheezein badalti hain: aapki likhi hui daleel policy ka wazan uthati hai, aur aapke defaults amalan policy ban jate hain — inhein aik page par saaf likhein

✓ **Correct answer / Sahi jawab: D**

Explanation: No policy removes your cover, so the record of reasoning matters more. Whatever people do becomes the rule; a one-page version (approved routes, red list, gate rule, capability rule, one named person) takes an afternoon.

Wazahat: Policy na ho to aapki hifazat nahi, is liye daleel ka record zyada ahem. Jo log karte hain wahi qaida ban jata hai; aik page (approved routes, red list, gate rule, capability rule, aik naamzad shakhs) aik dopahar ka kaam hai.

Q20. A retailer collected customers' phone numbers at checkout so it could send delivery updates. The marketing team now wants to run the list through Claude to draft personalised promotional messages. The data already sits inside the approved workspace. What governance question is still open?

Retailer ne delivery updates ke liye checkout par phone numbers liye. Ab marketing team Claude se promotional messages banana chahti hai. Data approved workspace mein hai. Kaunsa governance sawal abhi khula hai?

- A) None. The data is already inside an approved route, so any internal use of it is covered by the approval that let it in
Koi nahi
- B) Whether the purpose the numbers were collected for covers promotional use, which is a question for whoever owns the data, not a reason to carry on without asking
Kya jis maqsad ke liye numbers liye gaye woh promotion ko cover karta hai — yeh data ke malik ka sawal hai
- C) Whether the messages should be drafted in an incognito chat so the promotional drafts do not persist in memory across the team's later sessions
Incognito mein banayein
- D) Whether a smaller, faster model would be the cheaper choice for a high volume of short drafts, since promotional messages are straightforward, repetitive work that does not need deep reasoning
Chhota model sasta

✓ **Correct answer / Sahi jawab: B**

Explanation: An approved route answers where data may go, not what it may be used for. The numbers came for delivery updates; promotion is a different purpose.

Wazahat: Approved raasta batata hai data kahan ja sakta hai, kis kaam aa sakta hai nahi. Numbers delivery ke liye aaye; promotion alag maqsad hai.

Q21. A team lead adds an AI notetaker to the weekly customer call so nobody has to take minutes. It joins as a participant, records, and posts a summary to the team channel afterwards. The customers on the call are not told. Which of the four questions has been skipped?

Team lead haftawar customer call mein AI notetaker shamil karta hai jo record karke team channel par khulasa daalta hai. Customers ko nahi bataya jata. Chaar mein se kaunsa sawal chhoota?

A) The Case. Meeting minutes are relational work that should stay human-owned, so the notetaker is inappropriate regardless of what it records or who is told

The Case

B) None. Recording a call you are a party to is routine tooling, and the summary is reviewed by the team before anyone acts on it

Koi nahi

C) The People. Everyone on the call is affected, some jurisdictions require every participant's consent to a recording, and customers who find out later will not experience it as routine

The People — call par har shakhs mutasir hai, kuch ilaqon mein recording ke liye sab ki razamandi zaroori hai, aur baad mein pata chalne par customers ise aam nahi samjhenge

D) The Capability. A notetaker is a connector, so the fix is to start it read-only and widen its scope once it has run cleanly for three weeks without a complaint from anyone who was on the call

The Capability

✓ **Correct answer / Sahi jawab: C**

Explanation: The People question was skipped: customers were never told, and disclosure may be required by law before judgment. Read-only is the wrong picture — a recording participant already has the whole conversation.

Wazahat: *People wala sawal chhoota: customers ko bataya hi nahi, aur qanoonan disclosure zaroori ho sakta hai. Read-only yahan bemaani — record karne wala shareek poori guftagu le chuka.*

Course 10: Code You Never Write

<https://agentfactory.panaversity.org/docs/code-you-never-write-crash-course>

Practice Test — 32 MCQs

Q1. An office manager spends every Friday manually combining three exported files into one report and assumes she would need a programming course to automate it. What does Concept 1 say her real situation is?

Office manager har Friday teen exported files haath se jod kar report banati hai aur samajhti hai automate karne ke liye programming course chahiye. Concept 1 ke mutabiq asal soorat kya hai?

- A) She is right that automation requires learning to program first, so a short beginner programming course is the sensible place for her to start
Pehle programming seekhe
- B) Combining files is a judgment task, not a code task, so automating it would remove decisions the job really needs
Files jodna raaye ka kaam hai
- C) The job can be commissioned, not coded: she describes the repeating task and the AI writes and runs the script for her
Kaam commission ho sakta hai, code nahi karna — woh dohraya jane wala kaam bataye aur AI script likh kar chalayee
- D) Automation is possible but only worth it after the same report has been built by hand for a full year
Saal bhar haath se karne ke baad

✓ **Correct answer / Sahi jawab: C**

Explanation: The AI is the developer and she is the client, so the gate is description, not programming ability. The task fires Volume and Files with no judgment in it.

Wazahat: AI developer hai aur woh client; rukawat bayan karna hai, programming nahi. Kaam Volume aur Files ke signal deta hai, raaye nahi.

Q2. Someone tried AI for code in 2023, got handed a block of code they had nowhere to paste, and gave up. Concept 1 says the one thing to unlearn is what?

Kisi ne 2023 mein AI se code liya, paste karne ki jagah na mili aur chhod diya. Concept 1 ke mutabiq kya bhoolna hai?

- A) That the AI hands you code to deal with yourself. Today it writes the code and runs it in the same reply, with nothing installed
Yeh ke AI code thama kar chhod deta hai — ab woh usi jawab mein likhta aur chalata hai, kuch install nahi
- B) That AI code is unreliable, since the 2023 models actually wrote correct code that beginners back then simply pasted into the wrong place to run
AI code ghair-bharosemand hai
- C) That you still need Python installed somewhere, because the modern tools install it on your machine the first time
Python install chahiye
- D) That the language matters, since the real change is that you now choose the language instead of the model choosing it
Language aap chunte hain

✓ **Correct answer / Sahi jawab: A**

Explanation: The era of code-handed-to-you is over. The AI now writes and runs it together in a sandbox, with nothing on your side.

Wazahat: Code thamane ka daur khatam. Ab AI sandbox mein likhta aur chalata hai, aapki taraf kuch install nahi.

Q3. A reader asks why this course keeps insisting the AI, not the user, should pick the programming language. What is the reason Concept 2 gives?

Reader poochta hai course kyun kehta hai language AI chune, user nahi. Concept 2 ki wajah?

- A) The language does not matter to the final result, so whoever happens to pick it, including the user, will get an identical outcome anyway
Language se farq nahi
- B) Users tend to pick better languages than the AI, so the rule exists only to stop them from showing off knowledge they have
User behtar chunte hain
- C) The AI can only write one language at a time, so letting it choose avoids the confusion of mixing two in a single answer
AI aik waqt mein aik language
- D) Picking the language is a technical judgment you delegate, like a client describing a building and letting the architect choose steel or timber
Language chunna technical faisla hai jo delegate hota hai — jaise client imarat bataye aur architect steel ya lakdi chune

✓ **Correct answer / Sahi jawab: D**

Explanation: Language choice is a technical judgment you hand over (architect analogy). The language does affect fit: a number wants Python, a clickable tool wants JavaScript.

Wazahat: *Language chunna technical faisla hai jo aap saunpte hain (architect ki misaal). Fit par farq padta hai: number ke liye Python, click wale tool ke liye JavaScript.*

Q4. A network engineer's script renamed forty config files using the wrong rule and did it flawlessly in seconds. Concept 2 names the single property of code that explains both its power and this disaster. Which is it?

Network engineer ki script ne ghalat qaide se chalees config files seconds mein be-ghalti rename kar deen. Concept 2 code ki kaunsi aik khoobi batata hai jo taaqat aur tabahi dono samjhati hai?

- A) Code is fast, so any mistake it makes is simply over before a human could ever notice it happening at all
Code tez hai
- B) Code is exact in both directions: it executes correct instructions and wrong instructions with the same perfect, scaled obedience
Code dono taraf exact hai — sahi aur ghalat hidayaat dono ko barabar kaamil farmanbardari se bade paimane par chalata hai
- C) Code is written in many different languages, and the real danger comes from the AI occasionally choosing the wrong one for a given task
Kai languages
- D) Code is invisible to non-programmers, so errors hide inside syntax that the client was never able to read or check
Ghair-programmers ko nazar nahi aata

✓ **Correct answer / Sahi jawab: B**

Explanation: Code is exact in both directions: it computes to the last cent, and does exactly the wrong thing, perfectly, at scale. That is why a wrong brief is so costly.

Wazahat: *Code dono taraf exact hai: aakhri paise tak sahi hisaab, aur ghalat kaam bhi bilkul theek bade paimane par. Is liye ghalat brief bohat mehnga hai.*

Q5. A user wants a small calculator their team can open in a browser and click. Based on Concept 2, which language will the AI most likely reach for, and why does the user not need to know that in advance?

User chhota calculator chahta hai jo team browser mein khol kar click kare. Concept 2 ke mutabiq AI kaunsi language lega, aur user ko pehle kyun jaanna zaroori nahi?

- A) JavaScript, because the output is a thing you click, and the choice follows the output, which the AI decides on its own
JavaScript — output click wali cheez hai, aur chunao output ke peeche chalta hai jo AI khud tay karta hai
- B) Python, because Python is the language the AI knows best and therefore writes for absolutely every request it ever receives
Python hamesha
- C) Whichever the user names in the prompt, since a clickable tool only works if the client specifies the language up front
Jo user bataye
- D) It cannot be predicted at all, because language choice is random and unrelated to what the finished result is supposed to do
Pehle se nahi bataya ja sakta

✓ **Correct answer / Sahi jawab: A**

Explanation: A thing you click is JavaScript's ground; a number or file is Python's; the AI makes that call. The choice follows the output, which is why you can leave it to the AI.

Wazahat: Click wali cheez = JavaScript; number ya file = Python; AI faisla karta hai. Chunao output par munhasir hai, is liye AI par chhod sakte hain.

Q6. A user asks 'roughly how did my sales trend this year?', gets a confident conversational answer, and acts on it. Concept 3 flags a specific trap here. What is it?

User poochta hai 'is saal meri sales ka rujhan mota mota kaisa raha?', pur-aitmaad jawab milta hai aur us par amal karta hai. Concept 3 kaunsa jaal batata hai?

- A) This is a pure answer problem, so the conversational reply was correct and acting on it carried no real risk at all
Saaf jawab wala masla, koi khatra nahi
- B) The word 'roughly' was fine, but the year was too long a period for the model to summarize without writing code
Saal bohat lamba tha
- C) It looks like an answer problem but trips Precision: a decision rests on the number, so it is a code problem regardless of casual phrasing
Jawab wala lagta hai magar Precision chhedta hai — faisla number par tika hai, is liye yeh code masla hai chahe alfaaz aam hon
- D) Sales questions are always code problems no matter how casually they are phrased, so the only real error here was not uploading every prior year for full historical context
Sales hamesha code

✓ **Correct answer / Sahi jawab: C**

Explanation: The problem looks conversational but fires Precision, because a decision depends on the figure. The signal decides, not the topic.

Wazahat: Masla guftagu wala lagta hai magar Precision ka signal deta hai kyunke faisla number par hai. Topic nahi, signal faisla karta hai.

Q7. Of these four tasks, which one is a code problem under the Volume, Precision, Repetition, Files test?

Volume, Precision, Repetition, Files test ke mutabiq in chaar mein kaunsa code problem hai?

- A) Draft a warm but firm email politely turning down a vendor's meeting request for early next week
Vendor ki meeting se inkaar ki email
- B) Scan eighty supplier contracts and list every one with a non-standard cancellation clause
Assi supplier contracts scan karke ghair-maamooli cancellation clause wale list karna
- C) Decide whether a new product idea is worth pursuing given the current market
Naye product idea ka faisla
- D) Explain, for a beginner, what the difference between a stock and a bond is
Stock aur bond ka farq samjhana

✓ **Correct answer / Sahi jawab: B**

Explanation: Scanning eighty contracts fires Volume and Files. Code reads all eighty; a glance would miss some. Any one signal is enough.

Wazahat: Assi contracts = Volume + Files. Code sab parhta hai, nazar chook jati hai. Aik signal bhi kaafi hai.

Q8. A school administrator asked the AI to read a fee spreadsheet and say which families were behind. It confidently named eight, but the real number was eleven. How does Concept 3 explain the gap?

School administrator ne AI se fee spreadsheet parh kar baqi-daar families poochin. AI ne pur-aitmaad aath batayin, asal gyarah thin. Concept 3 farq kaise samjhata hai?

- A) The spreadsheet was corrupted, so no method could have produced the right count from data that broken to begin with
Spreadsheet kharab thi
- B) The model was just an older and weaker version, and any newer model would have read that same quick skim and counted them correctly
Purana model
- C) Eleven was wrong and eight was right, since the administrator miscounted the families who had already paid in full
Aath sahi tha
- D) The AI answered (it skimmed and pattern-matched) when it should have computed, and a skim reads a partial payment as fully paid
AI ne compute karne ki bajaye jawab diya (sarsari nazar aur pattern) — aur sarsari nazar mein adhoori payment poori lagti hai

✓ **Correct answer / Sahi jawab: D**

Explanation: The AI answered instead of computing; three partial payments read as paid. The fix is one sentence that forces computation.

Wazahat: AI ne hisaab ki jagah andaaze se jawab diya; teen adhoori payments poori lagin. Hal: aik jumla jo hisaab par majboor kare.

Q9. A user uploads a 5,000-row file and asks a data question. Concept 4 gives three lines to say. What is the job of the line that asks for row count, column names, and date range before any analysis?

User 5,000 rows ki file upload karta hai. Concept 4 ki teen lines mein woh line jo analysis se pehle row count, column naam aur date range maangti hai, uska kaam kya hai?

- A) It warms up the model on the whole file first so that the heavier analysis that follows it runs noticeably faster than it otherwise would
Model garam karti hai
- B) It satisfies a formatting requirement of the tool, which refuses to analyze any file until its structure is described first
Tool ki formatting shart
- C) It is optional politeness that makes no difference, since a capable model reads the whole file correctly whether asked or not
Ikhtiyari tehzeeb
- D) It is the cheapest lie detector: if the AI is truly reading the file those facts are exactly right, and invented ones expose a guess
Sab se sasta jhoot pakadne wala — AI waqai file parh raha ho to yeh baatein bilkul sahi hongy; ghadi hui baatein andaaze ko benaqab karti hain

✓ **Correct answer / Sahi jawab: D**

Explanation: Real reading gives exact counts and names; guessing gives round numbers and plausible-but-wrong column names — caught before you trust the analysis.

Wazahat: Asal parhai bilkul sahi count aur naam deti hai; andaaza gol numbers aur milte julte ghalat naam — analysis par bharose se pehle pakda jata hai.

Q10. A response about a user's data arrives with confident totals but no visible code block and no row counts. Concept 4 says to treat it as what?

User ke data par jawab pur-aitmaad totals ke saath aata hai magar code block aur row counts nahi. Concept 4 ise kya samjhne ko kehta hai?

- A) A finished analysis, since a missing code block only means the tool ran the code somewhere out of your sight
Mukammal analysis
- B) An opinion about the data rather than an analysis of it, the way you would treat an invoice for work you never saw
Data ke baare mein raaye, analysis nahi — jaise us kaam ka bill jo aapne dekha hi nahi
- C) A signal to immediately switch to a different AI product, because this one is incapable of running code on files
Doosra product
- D) Proof the file was too large, since the model omits code only when a dataset exceeds what it can process at once
File bohat bari thi

✓ **Correct answer / Sahi jawab: B**

Explanation: No code block, no counts, and no 'here is what I computed' means an opinion. Ask again for code rather than switching tools.

Wazahat: Code block nahi, count nahi = sirf raaye. Tool badalne ki bajaye dobara code maangein.

Q11. Concept 4 insists those lines say 'write and run code', never 'write and run Python'. What goes wrong if a beginner adds 'in Python'?

Concept 4 kehta hai 'write and run code' likhein, 'Python' nahi. Beginner 'in Python' jode to kya bigarta hai?

- A) It forces the AI's hand on a guess the beginner cannot justify, steering it wrong on the rare job Python does not fit
AI ko aise andaaze par majboor karta hai jise beginner saabit nahi kar sakta — jahan Python fit nahi wahan ghalat raasta
- B) Nothing goes wrong at all, because Python is always the single correct language and naming it simply confirms the AI's own obvious choice anyway
Kuch nahi
- C) The AI may refuse the request outright, since explicitly naming a language overrides its safety checks on code execution
AI inkaar kar dega
- D) It makes the code run more slowly, because the model has to translate the Python instruction before it can begin working
Code dheema

✓ **Correct answer / Sahi jawab: A**

Explanation: Naming the language forces a judgment the beginner is not equipped to make. Describe the job, demand code, leave the language alone.

Wazahat: Language ka naam lena aisa faisla thopna hai jiske liye beginner tayyar nahi. Kaam batayein, code maangein, language chhod dein.

Q12. Concept 5 claims people who half-know programming often write worse code briefs than total beginners. What is the reason?

Concept 5 kehta hai adhoori programming jaanne wale beginners se bhi bure brief likhte hain. Kyun?

- A) They write briefs that are simply far too short, because they assume the AI already knows everything a real programmer would know
Bohat chhote brief
- B) They are simply out of practice, so their briefs improve again as soon as they write a few of them after a long break
Practice nahi
- C) They micromanage the how (loops, libraries, the language) and under-specify the what, which is the outcome that actually matters
'Kaise' (loops, libraries, language) mein dakhil dete hain aur 'kya' — asal nateeja — kam batate hain
- D) They distrust the AI and so verify too much, which slows the brief down without making the final output any better at all
Zyada verify karte hain

✓ **Correct answer / Sahi jawab: C**

Explanation: The half-knowledgeable specify the how and skip the what, narrowing the AI's choices on preferences they cannot justify.

Wazahat: Adhoore jaanne wale 'kaise' batate aur 'kya' chhod dete hain, AI ke ikhtiyar aisi pasand par tang karte hain jo saabit nahi.

Q13. A complete code brief has five sections: Goal, Input, Output, Rules, Edge cases. Concept 5 says two of them are the ones beginners skip and the ones that prevent wrong answers. Which two, and what does each carry?

Code brief ke paanch hisse: Goal, Input, Output, Rules, Edge cases. Beginners kaunse do chhodte hain jo ghalat jawab rokhte hain?

- A) Goal and Input, which carry the purpose of the work and the files plus their formats that the AI will be operating on
Goal aur Input
- B) Rules and Edge cases, which carry your professional knowledge and your advance decision about what imperfect data should do
Rules aur Edge cases — aapka professional ilm aur adhoore data ke baare mein pehle se faisla
- C) Output and Rules, which carry the shape of the result you want back and the constraints that a total stranger would not know
Output aur Rules
- D) Input and Edge cases, which carry the raw files coming in and the handling of any rows that turn out to be malformed
Input aur Edge cases

✓ **Correct answer / Sahi jawab: B**

Explanation: Rules carry your professional knowledge (e.g., a school year that starts in August). Edge cases carry your advance decision about blank rows and duplicates.

Wazahat: Rules mein aapka professional ilm (maslan school saal August se). Edge cases mein khaali rows aur duplicates ka pehle se faisla.

Q14. A user really does not know what messy surprises hide in their data, so they cannot write the Edge cases section. What does Concept 5's tip say to do?

User nahi jaanta data mein kya gadbad chhupi hai, is liye Edge cases nahi likh sakta. Concept 5 ka mashwara?

- A) Guess the most likely data problems from past experience and write the section anyway, then correct it later if the guesses turn out wrong
Andaaza laga kar likhein
- B) Skip the Edge cases section entirely, since a well-written Goal and Output will cover any data problems that come up
Section chhod dein
- C) Clean the data fully by hand in Excel first, so that by the time the AI sees it there are no edge cases left to specify
Pehle Excel mein haath se saaf karein
- D) Make discovery the first prompt: ask the AI to inspect the files and report what is ambiguous, then write Edge cases with knowledge
Pehla prompt discovery ho — AI files jaanch kar mubham cheezein bataye, phir ilm ke saath Edge cases likhein

✓ **Correct answer / Sahi jawab: D**

Explanation: Inspect, ask, then brief: have the AI examine the files and report blank dates or mixed currencies, so you write Edge cases from knowledge.

Wazahat: Jaanchein, poochein, phir brief: AI files dekh kar khaali dates ya mili currencies bataye, phir ilm se Edge cases likhein.

Q15. Concept 6 answers the skeptic's question, 'if you cannot read the code, how do you know it is correct?'. What is its core answer?

Concept 6 shakki ke sawal ka jawab deta hai: 'code parh nahi sakte to kaise pata sahi hai?' Buniyadi jawab?

- A) You learn just enough syntax to skim the code yourself, which is really the only honest way to confirm that the logic inside it is sound
Thoda syntax seekhein
- B) You trust the AI's stated confidence, because a model that says it is sure about a result is reliably correct about it
AI ke confidence par bharosa
- C) You verify outputs against independent knowledge you already have, the way you check any expert whose craft you cannot audit
Output ko us ilm se check karein jo aapke paas pehle se hai — jaise kisi bhi maahir ko jiska fun aap nahi jaanchte
- D) You re-run the same prompt several times and accept the answer whenever the model returns the identical number each time
Kai baar chalayein

✓ **Correct answer / Sahi jawab: C**

Explanation: Check results against knowledge you already have, as you check an accountant by your records. Re-running repeats the same logic, so agreement proves nothing.

Wazahat: Nataij ko apne maloom ilm se jaanchein, jaise accountant ko apne records se. Dobara chalana wahi logic dohrata hai, is liye ittifaq kuch saabit nahi karta.

Q16. Concept 6 calls one check 'the single most powerful move on this page'. Which is it, and what makes it so strong?

Concept 6 aik check ko 'is page ka sab se taaqatwar qadam' kehta hai. Kaunsa aur kyun?

- A) The known-answer test: run the code on a slice whose answer you already know, so trust in the unseen answers is earned
Known-answer test — aise hisse par chalayein jiska jawab pehle se maloom ho; is se an-dekhe jawabon par bharosa kamaya jata hai
- B) The plain-English replay, because hearing the procedure described aloud is the fastest way to expose a flawed assumption
Plain-English replay
- C) The cross-model check, because two completely different AI families agreeing on a single number removes every doubt about a result
Cross-model check
- D) The adversarial pass, because asking the AI to attack its own work surfaces more hidden bugs than any other technique
Adversarial pass

✓ **Correct answer / Sahi jawab: A**

Explanation: Reproducing an answer you already know turns hope into earned trust for the answers you cannot check — the everyday firewall.

Wazahat: Maloom jawab dohrana umeed ko kamaye hue bharose mein badalta hai — roz ki hifazati deewar.

Q17. A pharmacist added one fake gap that she invented herself into a copy of her data, then ran the stock-check script on it. Concept 6 presents this as an elegant form of which check, and why did it work?

Pharmacist ne data ki copy mein aik nakli kami khud daali, phir stock-check script chalayi. Concept 6 ise kis check ki umda shakal kehta hai?

- A) A known-answer test, because she added one error she already knew about. The script caught it plus four real gaps, and the known one is what let her trust the four
Known-answer test — usne aik maloom ghalti daali; script ne woh aur chaar asli kamiyan pakdin, aur maloom wali ne chaar par bharosa dilaya
- B) The reality questions, because she compared the script's output against the totals she expected from running the pharmacy
Reality questions
- C) The cross-model check, because by planting an error she effectively ran a whole second independent analysis to set against the first one and compare the final results
Cross-model check
- D) The adversarial pass, because adding an error is the same as asking the code to find every way it could be wrong
Adversarial pass

✓ **Correct answer / Sahi jawab: A**

Explanation: Adding one known error is the known-answer test in its most elegant form. Catching it earns trust in the four real gaps she did not know about.

Wazahat: Aik maloom ghalti daalna known-answer test ki umda shakal hai. Use pakadna chaar anjaan kamiyon par bharosa dilata hai.

Q18. A script finishes with no error, but the total sales figure looks far too low to the user. Concept 7 says the wrong move is 'it is wrong, fix it'. What is the right move?

Script bina error chalti hai magar total sales bohat kam lagti hai. Concept 7 kehta hai 'ghalat hai, theek karo' ghalat qadam hai. Sahi kya?

- A) Immediately stop and start a brand-new conversation from scratch, since a wrong number nearly always means the current chat itself has become hopelessly confused already
Nayi chat
- B) Ask the AI to rewrite the entire script from scratch using a completely different approach before investigating what broke
Poori script dobara
- C) Accept the number, because a script that runs without an error has by definition produced a correct and trustworthy result
Number maan lein
- D) Report it like a symptom to a doctor: state the figure, your expected value, and ask it to show row count and sample rows first
Doctor ko alamat ki tarah batayein — figure, aapki tawaqqo, aur pehle row count aur sample rows dikhane ko kahein

✓ **Correct answer / Sahi jawab: D**

Explanation: Report wrong-but-running output as a specific symptom with the expected value, and ask it to inspect row count, date range, and sample rows before any fix.

Wazahat: Chalne wala magar ghalat output khaas alamat ki tarah batayein, tawaqqo ke saath, aur fix se pehle row count, date range aur sample rows jaanchwayein.

Q19. A marketer pasted a crash error mentioning a 'codec' into the chat without understanding a single word of it, and the AI fixed it in forty seconds. Concept 7 draws which lesson from this?

Marketer ne 'codec' wala crash error bina samjhe paste kiya aur AI ne chalees second mein theek kar diya. Concept 7 kya sabaq nikalta hai?

A) She should learn what a codec is, because understanding the error category would have let her prevent the crash next time

Codec seekhe

B) Reading errors is not required, only willingness to paste them, because the AI reads its own error messages and repairs the code

Error parhna zaroori nahi, sirf paste karne ki himmat — AI apne error khud parh kar code theek karta hai

C) Some errors are unfixable by AI, so a codec error specifically is a sign the file must be recreated in different software

Kuch errors AI theek nahi kar sakta

D) Pasting errors only ever works for the simple crashes, and anything even mentioning encoding needs a real human programmer to step in and help

Sirf aasaan crashes

✓ **Correct answer / Sahi jawab: B**

Explanation: Reading errors is not required, only willingness to paste them. The AI reads its own messages the way a mechanic reads engine noise.

Wazahat: Error parhna zaroori nahi, sirf paste karna. AI apne messages aise parhta hai jaise mechanic engine ki awaaz.

Q20. The same fix has now failed three times in a row on a stubborn problem. Concept 7 says three strikes means what, and prescribes which move?

Aik hi fix teen baar fail ho chuka. Concept 7 ke mutabiq teen strikes ka matlab aur qadam kya?

A) The data is corrupt beyond repair, so the only option left is to re-export the file and begin the whole task again

Data kharab

B) The model is overloaded, so waiting an hour and resubmitting the exact same request will usually let it succeed on the next try

Model overload

C) The approach is wrong, not the typing: ask the AI to step back, restate the problem fresh, and propose two different approaches

Tareeqa ghalat hai, typing nahi — AI peeche hat kar masla naye sire se bayan kare aur do mukhtalif tareeqe tajweez kare

D) The task is simply beyond current AI, so the remaining honest move is to do this particular job by hand instead

Kaam AI ke bas ka nahi

✓ **Correct answer / Sahi jawab: C**

Explanation: Three strikes means the approach is wrong. Have the AI restate the problem and propose two different approaches; start a clean chat if the conversation is tangled.

Wazahat: Teen strikes = tareeqa ghalat. AI masla dobara bayan kare aur do alag tareeqe de; chat uljhi ho to nayi shuru karein.

Q21. A teacher's submission-check took real effort to brief the first time. On the next assignment the same job was one sentence. Concept 8 calls this the payoff of which signal, and what is the shift underneath?

Teacher ka submission-check pehli baar mehnat se brief hua; agli assignment par aik jumla. Concept 8 ise kis signal ka faida kehta hai?

- A) Precision, because once the rules are correct the script never makes an arithmetic error on any future term's figures again
Precision
- B) Volume, because the script's real value is that it handles far more rows than the teacher ever could by hand alone
Volume
- C) Repetition: a script written once becomes an asset you own, so you stop using AI and start accumulating with it
Repetition — aik baar likhi script aapka asasa ban jati hai; aap AI use karne se barh kar us ke saath jama karna shuru karte hain
- D) Files, because the submission list lives in spreadsheets and the script's worth is simply that it can open those files for her
Files

✓ **Correct answer / Sahi jawab: C**

Explanation: A script written once is an asset; reusing it is the move from using AI to accumulating with it, the first step toward AI Workers.

Wazahat: Aik baar likhi script asasa hai; dobara use karna AI 'use' se 'jama' karne ki taraf qadam hai — AI Workers ki pehli seedhi.

Q22. Concept 8 says to save the Markdown brief alongside the script file, not just the script. What is the reason to keep both?

Concept 8 kehta hai script ke saath Markdown brief bhi save karein. Dono kyun?

- A) The brief makes the script run faster, because the AI reads the brief first to understand the code before executing it
Brief script tez karta hai
- B) The script is the how (for machines) and the brief is the what and why (for humans and future AI), so changes need no re-explaining
Script 'kaise' hai (machines ke liye), brief 'kya aur kyun' (insanon aur aainda AI ke liye) — tabdeeli par dobara samjhana nahi padta
- C) The brief is mainly a legal record proving exactly who commissioned the work, which matters if a colleague later disputes who actually built the script
Qanooni record
- D) Keeping two files is only tidier, because either one alone would let a future AI session update the logic without losing context
Sirf safai

✓ **Correct answer / Sahi jawab: B**

Explanation: When a rule changes, you hand over both and say 'update it' instead of explaining from scratch. The script alone leaves future edits without intent.

Wazahat: Qaida badle to dono de kar 'update karo' kahein. Akeli script mein niyat nahi hoti.

Q23. Concept 9 calls Claude.ai's code execution a 'sandbox' and names it the zero-risk surface to learn on. What exactly makes it zero-risk, and what is its matching limit?

Concept 9 Claude.ai ki code execution ko 'sandbox' aur seekhne ki be-khatra jagah kehta hai. Be-khatra kyun, aur had kya?

- A) It runs on your own machine but inside a protected folder, so the limit is that it can only reach files in that one folder
Aapki machine ke mehfooz folder mein
- B) It never runs real code at all, only simulates it, so the limit is that its numbers are estimates rather than true computations
Asli code nahi chalata
- C) It automatically backs up your computer before each run, so the only limit is that very large files take a long time to copy
Backup leta hai
- D) It is a temporary computer on the provider's side that never touches your machine, and its limit is that it sees only what you upload
Provider ki taraf aarzi computer jo aapki machine ko nahi chhoota — had yeh ke sirf upload ki hui cheezein dekhta hai

✓ **Correct answer / Sahi jawab: D**

Explanation: A temporary computer on the provider's side: uploads in, results out, nothing on your machine touched. Limit: it sees only what you upload.

Wazahat: Provider ka aarzi computer: upload andar, nateeja bahar, aapki machine mehfooz. Had: sirf upload ki hui cheez dekhta hai.

Q24. A network engineer needs a script to log into forty devices on his network every morning before he arrives and write a health report. Concept 10 says which surface fits, and why can the browser sandbox not do this?

Network engineer ko script chahiye jo har subah uske aane se pehle network ke chalees devices mein login karke health report likhe. Kaunsi surface munasib hai aur browser sandbox kyun nahi?

- A) Claude Code or OpenCode, because only code living on his own machine can run on a schedule and touch systems a browser tab cannot reach
Claude Code ya OpenCode — sirf uski machine par rehne wala code schedule par chal kar aise systems chhoo sakta hai jahan browser tab nahi pahunchta
- B) Claude.ai, because the sandbox can reach any networked device once the engineer uploads the device list as a file to it
Claude.ai
- C) Cowork or OpenWork, because the plan-then-approve step is what makes logging into network devices safe enough to automate
Cowork/OpenWork
- D) Any one of the five surfaces would do here, since scheduled network tasks work essentially identically everywhere and the choice comes down to purely personal preference
Koi bhi

✓ **Correct answer / Sahi jawab: A**

Explanation: This needs code running from his machine, on his network, on a schedule — the terminal surface. The sandbox cannot reach his network or run on a schedule.

Wazahat: Is ke liye code uski machine se, uske network par, schedule par chalna chahiye — terminal surface. Sandbox na network tak pahunchta na schedule par chalta.

Q25. Concept 10 reframes the terminal for people who flinch at the word. What is the reframe, and what does it let the agent do that the browser cannot?

Concept 10 'terminal' se darne walon ke liye nayi tasveer deta hai. Kya, aur agent browser se zyada kya kar sakta hai?

- A) The terminal is a faster web browser, so the agent loads your files from the cloud more quickly than a normal chat tab
Tez browser
- B) The terminal is a chat box that sits inside a folder, so the agent sees the files already there with nothing to upload
Terminal aik chat box hai jo folder ke andar baitha hai — agent wahan ki files bina upload dekhta hai
- C) The terminal is a programming editor, so the agent expects you to write some of the code yourself alongside it as it works
Programming editor
- D) The terminal is a backup tool, so its main advantage is automatically copying your folder before the agent changes anything
Backup tool

✓ **Correct answer / Sahi jawab: B**

Explanation: The terminal is a chat box inside a folder: you type sentences, and the agent sees files there, runs code on them, and keeps scripts, with no uploading.

Wazahat: *Terminal folder ke andar chat box hai: aap jumle likhein, agent wahan ki files dekhta, code chalata aur scripts rakhta hai — upload nahi.*

Q26. Concept 11 says Cowork and OpenWork have a defining feature the other surfaces leave to your discipline. What is it, and which earlier verification step does it embody?

Concept 11 kehta hai Cowork aur OpenWork ki khaas khoobi woh hai jo doosri surfaces aapke discipline par chhodti hain. Kya hai?

- A) Plan first and act after approval, which is Concept 6's plain-English replay moved before the work instead of after it
Pehle plan, manzoori ke baad amal — yeh Concept 6 ka plain-English replay hai jo kaam se pehle aa gaya
- B) Unlimited file access, which is Concept 6's reality questions applied automatically to every file the app can see on disk
La-mehdood file access
- C) Automatic cross-model checking, which is Concept 6's second-model check run silently on every result
Automatic cross-model
- D) Permanent script storage, which is Concept 8's keep-the-script habit handled for you without any prompt being needed
Script storage

✓ **Correct answer / Sahi jawab: A**

Explanation: Plan first, act after approval: you read the plan, catch the wrong assumption, then approve.

Wazahat: *Pehle plan, phir manzoori par amal: plan parhein, ghalat mafrooza pakdein, phir approve karein.*

Q27. Concept 12 warns that the moment code runs on your own machine, two facts from the prompting course bite. Which two, and why do they raise the stakes?

Concept 12 kehta hai jab code aapki machine par chale to prompting course ke do facts kaat-te hain. Kaunse?

- A) Agents run slower on local machines, and they use more memory, so a careless run can freeze the computer mid-task
Dheema aur zyada memory
- B) Local code cannot be verified, and it cannot be saved, so any mistake it makes is both invisible and impossible to repeat
Verify aur save nahi
- C) Files deleted by an agent often skip the recycle bin, and files edited by a script keep no undo history, so mistakes can be unrecoverable
Agent ki delete ki files aksar recycle bin mein nahi jatin, aur script ki edits ki undo history nahi — ghaltiyan na-qabil-e-wapsi ho sakti hain
- D) The AI loses all access to the internet, and it also forgets the original brief, so local runs drift away from whatever you first asked for
Internet aur brief bhool jata hai

✓ Correct answer / Sahi jawab: C

Explanation: Deletions often skip the recycle bin and script edits keep no undo history, so a misunderstood brief can do damage at scale with no way back.

Wazahat: Deletions recycle bin se bachti hain aur edits ki undo history nahi — ghalat samjha brief bade paimane par na-qabil-e-wapsi nuqsan kar sakta hai.

Q28. Before letting an agent rename, move, or delete real files, Concept 12 prescribes a dry run. What does demanding a dry run actually buy you?

Agent se asli files rename/move/delete karwane se pehle Concept 12 dry run kehta hai. Is se kya milta hai?

- A) A speed gain, because previewing the operations lets the agent run the real ones faster once you finally approve them
Raftaar
- B) A guarantee the agent cannot make any mistake, since a previewed operation is by definition the correct one to perform
Ghalti na hone ki zamanat
- C) A full backup of all the files, because generating the operation list automatically copies everything the agent is about to touch
Poora backup
- D) A list of every operation it would perform, so you catch a misunderstanding while it is still words instead of actions
Har operation ki list — ghalat fehmi tab pakdein jab woh abhi alfaaz hai, amal nahi

✓ Correct answer / Sahi jawab: D

Explanation: A dry run shows every operation with old and new names, then waits — catch the misunderstanding while it is still words. Backup is a separate rule.

Wazahat: Dry run har operation purane aur naye naam ke saath dikha kar rukta hai — ghalat fehmi alfaaz mein hi pakdi jati hai. Backup alag qaida hai.

Q29. A researcher asked an agent to delete duplicate interview recordings. The dry run listed forty deletions, six of them files that were actually different interviews. What does Concept 12 say saved the six, and what does that show?

Researcher ne agent se duplicate interview recordings delete karwayin. Dry run mein chalees deletions thin, jin mein chhe asal mein alag interviews thin. Kis cheez ne chhe bachayin?

- A) The agent's own built-in caution caught them, showing that modern agents very rarely propose a destructive file operation by mistake
Agent ki apni ehtiyaat
- B) The recycle bin held them, showing that deleted files can always be restored if you act quickly enough after the run
Recycle bin
- C) A backup copy restored them afterward, showing that working on copies alone removes the need to read the plan at all
Backup
- D) A two-minute read of the plan before any file moved, showing the dry-run ritual is what turns a catastrophe into a shrug
Kisi file ke hilne se pehle plan ka do minute parhna — dry run ki aadat tabahi ko maamooli baat bana deti hai

✓ **Correct answer / Sahi jawab: D**

Explanation: A two-minute read of the dry-run plan: she spotted the bad rule (name and size, not content), corrected it, and the six survived.

Wazahat: Dry run plan ka do minute mutala: usne ghalat qaida (naam aur size, content nahi) pakda, theek kiya, aur chhe bach gayin.

Q30. Concept 13 maps the edge of one-prompt code. Which of these tasks sits ACROSS that edge, needing more than a chat prompt?

Concept 13 one-prompt code ki had batata hai. Kaunsa kaam us had se BAHAR hai?

- A) Totalling a year of your own bank transactions by category and flagging the months you overspent your budget
Saal bhar ki bank transactions ka total
- B) Renaming three hundred vacation photos using the date stored inside each file, after a dry run you read and carefully approved first
Teen sau photos rename, dry run ke baad
- C) An always-on service that emails your clients automatically every week while running unattended with no human review
Hamesha chalne wali service jo har hafte clients ko bina insaani review ke khud email kare
- D) Reconciling your ledger against the bank statement and producing a report your senior can read and check
Ledger reconciliation report

✓ **Correct answer / Sahi jawab: C**

Explanation: Unattended, always-on automation is across the edge: where Concept 6's checks cannot reach, it needs eval-driven discipline, not a chat prompt.

Wazahat: Bina nigrani hamesha chalne wali automation had se bahar hai: wahan Concept 6 ke checks nahi pahunchte, eval-driven discipline chahiye.

Q31. Concept 13 warns about 'judgment wearing a computation costume', using 'compute which employees to promote' as the example. What is its point?

Concept 13 'hisaab ka libaas pehne raaye' se khabardar karta hai — misaal: 'compute karo kise promote karein'. Nukta kya hai?

- A) The arithmetic is trivial but the criteria are the entire problem, and the criteria are yours to decide, not the code's
Hisaab maamooli hai, magar criteria hi poora masla hain — aur criteria aapko tay karne hain, code ko nahi
- B) The task is impossible for AI, since ranking people is something no current model can compute with any accuracy at all
AI ke liye namumkin
- C) It is a normal code problem, so the only real risk is forgetting to verify the promotion scores with a known-answer test
Aam code masla
- D) The promotion decision should be fully automated, because removing the human is what makes the process fair and consistent
Poori tarah automate karein

✓ **Correct answer / Sahi jawab: A**

Explanation: The math is trivial, but the criteria are the whole problem and belong to you: code computes while you decide.

Wazahat: *Hisaab aasaan hai, criteria asal masla hain aur aapke hain: code hisaab kare, faisla aap.*

Q32. The recap reduces the whole course to one identity and one skill that the prompting course never needed. Which pairing does it name?

Recap poore course ko aik pehchaan aur aik maharat mein samet-ta hai. Kaunsi jodi?

- A) You are the contractor, not the client, and the skill is learning to read just enough code to confirm it does what you wanted
Aap contractor hain; thoda code parhna
- B) You are the client, not the contractor, and the skill is trusting work you cannot see by testing it against what you know
Aap client hain, contractor nahi — maharat: an-dekhe kaam par bharosa, use apne maloom ilm se test karke
- C) You are the manager, not the worker, and the skill is choosing which AI model to assign to each separate kind of task
Aap manager hain; model chunna
- D) You are the author, not the editor, and the skill is writing prompts so precise that verification becomes unnecessary
Aap author hain; verification ghair-zaroori

✓ **Correct answer / Sahi jawab: B**

Explanation: Identity: you are the client, not the contractor. Skill: trust work you cannot see, because you tested it against something you already knew.

Wazahat: *Pehchaan: aap client hain, contractor nahi. Maharat: an-dekha kaam bharose ke layak, kyunke aapne use maloom cheez se test kiya.*
