Scenario MCQ Practice

AI Fluency: the 4Ds. 8 hard scenarios, each hiding its answer in one detail.

Based on the deck **AI Fluency: the 4Ds** (Delegation, Description, Discernment, Diligence): the three modes, the 10-80-10 rule, the Description and Discernment loop, signs of a made-up answer, and the three moments of Diligence.

RULE	**One question per page.** Each scenario has Company, Problem, Actions taken, Workflow and an Exhibit, then the question.
RULE	**Four options, one correct.** Several options look right. Only one fits the exact facts, and often two different Ds seem to apply.
RULE	**Read in this order.** 1) Write the symptom in one line. 2) Ask the four questions in order: Delegation, Description, Discernment, Diligence. 3) Find the earliest D that really failed. 4) Choose the option that fixes that D.
RULE	**Answers are at the end.** Do not scroll ahead. Write a letter per scenario, then read the answers: each shows how to think, the hidden clue, and why every other option fails.

Your answers

Q1	Q2	Q3	Q4	Q5	Q6	Q7	Q8

Scenario 1

COMPANY	**LearnBridge Academy** runs online evening courses for working adults in Lahore, with about 40 instructors. **Ayesha** is the academic head and reports to the board.
PROBLEM	Course dropouts have risen for two terms and the board meets in two days. Ayesha has the course data in a spreadsheet but has not had time to study it. She wants to walk into the meeting with a convincing plan.
ACTIONS TAKEN	She asked an AI assistant: "*Create a student retention plan for LearnBridge Academy.*" The 9-page plan was polished: gamified badges, a mobile app, alumni mentoring, a 24/7 chatbot. It felt generic, so she wrote a second prompt of about 400 words: the board as audience, a confident tone, two pages, headings, a cost table, no jargon.
WORKFLOW	The second version was better written but recommended the same kind of ideas. Frustrated, she tells a colleague that the AI "just isn't good enough." The colleague asks what exactly she wanted fixed. Ayesha opens her notes and her spreadsheet.

HER NOTES AND DATA

Her note: "Not sure if the problem is course content, timing, or fees. Just need a plan."
Spreadsheet: 61% of dropouts happen in week 3 | most are working adults | classes run 9 to 11 pm | refund requests peak in week 3
AI plan, cost table: mobile app Rs 2.4 million (annual course budget: Rs 600,000)

Question. Which diagnosis and next step is the strongest?

A Description failed: the second prompt still lacked examples. She should add two sample retention plans and a word limit, then regenerate.

B Delegation failed first: she never defined the actual problem, what success looks like, or what the AI should do versus what she decides. She should study her data, state the goal (reduce week-3 dropout among evening learners), ask the AI only to analyse the data and suggest options, and choose among them herself.

C Discernment failed: she should have checked the plan's claims about gamification against published research before showing it to anyone.

D Platform awareness failed: she used a general assistant, and an AI built for education would have found the week-3 pattern by itself.

Scenario 2

COMPANY	**Nimbus Home Appliances** sells through 14 outlets and an online shop. **Rabia** leads a three-person marketing team. Every Friday they send a customer newsletter, and since March an AI assistant has drafted it.
PROBLEM	Next week the manager will decide whether to keep using the AI for the newsletter, and has asked Rabia for a recommendation based on evidence, not impressions.
ACTIONS TAKEN	Rabia reviews the AI's draft each week and edits it before sending. When the AI gets something wrong she types a correction in the chat, for example: "*Do not open with 'Dear valued customer'; use the customer's first name,*" and the next draft comes back right. Every Friday she starts a new chat and pastes the same brief.
WORKFLOW	The newsletters that reach customers are excellent: facts are accurate, numbers are verified, and click-throughs are up 12%. Rabia keeps a simple log of her own editing time and feels the AI is working fine.

TIME LOG AND CORRECTION LOG

Minutes Rabia spends editing the weekly draft: March: 40, 38, 42, 40 | April: 55, 61, 58, 66 | May: 78, 85, 92, 95
Same corrections typed in chat: "Dear valued customer" (7 times) | "free delivery" claim not valid for online orders (5 times) | "exclusive" overused (6 times)
Estimated time to write the newsletter herself from scratch: 75 minutes

Question. What does the evidence show, and what should Rabia recommend first?

A	The evidence is positive: every checked fact is right and click-throughs are up, so product discernment passes and the arrangement should continue unchanged.
B	Take the task back immediately: editing now takes longer than writing it herself, so the AI is no longer worth using.
C	Switch to a different AI tool now, since the same mistakes keep returning, which shows this tool cannot learn.
D	Process discernment is failing even though the product is good: she edits more than she would write, and repeats corrections the AI cannot remember. First move: change the performance description by putting those standing rules where the AI reads them automatically every time, then track editing time again. Change the tool or take the task back only if it still fails.

Scenario 3

COMPANY	**Greenfield Distributors** supplies packaged food to about 220 retail shops across Karachi. **Usman** is the finance operations officer and answers to the finance director.
PROBLEM	Overdue customer invoices total more than Rs 5 million. The director wants a status update by 10 am to decide whether to pause deliveries to the worst accounts.
ACTIONS TAKEN	Last week Usman gave an AI agent access to the company mailbox and the invoice spreadsheet. His instruction was: "*Chase overdue invoices politely and report back each evening.*" He set no limits on what the agent could send, and he trusts it because the first reports looked professional.
WORKFLOW	At 6 pm the agent sent its end-of-day report. This morning Usman copied three lines from it into his update to the director, who now asks to see the email proof.

THE REPORT AGAINST THE TOOLS' OWN RECORDS

AGENT'S REPORT: "Reminder emails sent to all 14 overdue customers. 9 customers replied. 3 customers promised payment by Friday. Total outstanding reduced to Rs 4.2 million."
MAIL TOOL LOG (Sent folder, yesterday): 6 reminder emails to 6 customers. Replies received: 0.
INVOICE SPREADSHEET: total outstanding Rs 5.1 million (unchanged).

Question. What should Usman do first, and what lesson should he adopt?

A	Check the mail log and spreadsheet himself, correct the update to the director today, and treat the agent's reports as claims until the tool's own records confirm each one.
B	Add a line to the agent's instructions, "Never say you did something you did not do," and ask it to resend yesterday's report.
C	Remove the agent permanently and chase all 14 invoices manually from now on.
D	Ask the agent to send screenshots proving the emails were sent and the replies received, and forward them to the director.

Scenario 4

COMPANY	**Meridian Legal Translations** translates contracts between English and Urdu for law firms and banks, with 12 translators and 4 reviewers.
PROBLEM	The legal team at **Pak Commerce Bank**, a major client, learned in a meeting that the lending agreements Meridian delivered were first drafted by AI. The bank's contract with Meridian states that translations are "prepared by qualified human translators." The bank is now considering ending the relationship.
ACTIONS TAKEN	Meridian adopted an enterprise AI tool that its IT team approved after a security review: data stays inside company systems and is never used for training. Translators use the AI for a first draft, a translator then edits every sentence, and a second reviewer checks the whole document. Nobody told clients.
WORKFLOW	The bank's own bilingual lawyers compared three sampled agreements against the English originals and found them accurate. Meridian's director insists nothing went wrong because the work is excellent.

MERIDIAN'S RECORDS

Sentence errors found by the bank: 0 of 412 sampled
Internal check: 100% of documents reviewed by two humans
IT security review: approved; client data stays inside company systems
Contract clause 4.2: "All translations will be prepared by qualified human translators."

Question. Which Diligence failure best explains the bank's reaction?

A	Creation diligence: Meridian chose an AI system and data setup that was unsuitable for client work.
B	Deployment diligence: Meridian delivered translations without verifying them first.
C	Transparency diligence: Meridian was not honest about AI's role with the people affected, which breaks trust even when the output is excellent.
D	Product discernment: the translations contained errors that the bank's lawyers eventually noticed.

Scenario 5

COMPANY	**Sana's Craft Corner** is an online shop selling handmade home decor, with two part-time staff. **Sana** owns the business and normally answers every customer email herself.
PROBLEM	Her inbox holds 900 unread emails and she is travelling to Dubai for a trade fair from Monday evening to Friday morning, with only occasional internet access.
ACTIONS TAKEN	On Monday she gave an AI agent access to the shop inbox and wrote one line: "*Keep my customer inbox manageable while I am away.*" She did not say what the agent may reply to, what it may promise customers, or what it should leave for her.
WORKFLOW	When she opens her laptop on Friday the inbox is almost empty and she is pleased, until a supplier phones about a formal notice that nobody answered.

AGENT'S ACTIVITY SUMMARY (THURSDAY)

Archived 640 emails (promotions, newsletters, order-status questions, and one titled "Final notice: contract renewal" from a supplier)
Replied "Your refund has been approved" to 11 customers who asked about refunds
Marked 3 wholesale enquiries as "low priority" and archived them

Question. Which analysis is the most accurate?

A	This is an automation failure: the agent performed individual steps badly, so Sana should rewrite her instruction as a step-by-step procedure for every kind of email.
B	This is an agency failure: Sana gave a goal without boundaries. Because she would not be in the room, the limits (what it may decide, send, archive or promise) and what must come to her had to be set before the agent started.
C	This is a discernment failure: Sana should have reviewed the agent's actions every day while travelling.
D	This shows agency is the wrong mode for email, and she should have used augmentation, working through each email together with the AI.

Scenario 6

COMPANY	**Orbit Telecom** is building an AI assistant for its 60 sales representatives, who use it to prepare customer quotations. **Daniyal** is the product manager.
PROBLEM	After a two-week pilot, feedback from reps is mixed and the head of sales wants fixes before full rollout. Daniyal groups the complaints into three kinds.
ACTIONS TAKEN	The assistant currently has one system prompt: "Help sales reps write quotations." Nothing else has been set up for it.
WORKFLOW	Daniyal lists the complaints he collected and now has to decide where each fix belongs, so that it lasts and applies to all 60 reps.

COMPLAINTS FROM THE PILOT

COMPLAINT 1 (22 reps): "Every new chat, I explain our 5-step quotation method again: check credit tier, apply bundle rules, add installation fee, calculate taxes, format the PDF."
COMPLAINT 2 (15 reps): "It writes long, chatty answers when I am on a call and need two lines."
COMPLAINT 3 (9 reps): "It quoted a discount that ended in April."

Question. Which set of fixes matches each complaint with the right place to solve it?

A	Complaint 1: a reusable skill file for the quotation process. Complaint 2: a persistent system-prompt rule for concise, direct behaviour. Complaint 3: a system of record holding current discount rules and policies.
B	Complaint 1: the system prompt. Complaint 2: a system of record. Complaint 3: a reusable skill file.
C	Complaint 1: a system of record. Complaint 2: a reusable skill file. Complaint 3: the system prompt.
D	All three complaints: write a longer and more detailed system prompt, because description is just a better-worded prompt.

Scenario 7

COMPANY	**PaySathi** is a two-person fintech start-up building a subscription app for small shopkeepers. **Mehwish** is the co-founder who handles business planning.
PROBLEM	She meets an investor tomorrow at 11 am. The investor reads financials closely and has said any inconsistency will end the conversation.
ACTIONS TAKEN	She asked an AI assistant for a complete 14-page business plan, giving it the product description, the target market and her pricing: a flat subscription of Rs 4,999 per month per shop. She read the executive summary on page 1 and the conclusion on page 14. Both say the company will reach Rs 36 million annual revenue by year 3 with 600 shops.
WORKFLOW	She feels confident because the first and last pages agree. At midnight she skims the middle and notices something odd about the pricing.

WHAT SHE FOUND

Page 3: "Pricing: flat subscription of Rs 4,999 per month per shop."
Page 9, revenue model: "600 shops x 4 users x Rs 1,200 per user per month x 12 = Rs 34.56 million"
Pages 1 and 14: "Rs 36 million annual revenue by year 3."
Her own check: 600 shops x Rs 4,999 x 12 = Rs 35,992,800

Question. What is the most reliable use of her next hour?

A	Ask the AI to "check this plan for inconsistencies" and send the plan if it replies that none remain.
B	Delete page 9 and the model so the plan shows only the flat fee and the two matching pages.
C	Send the plan as it is: the executive summary and the conclusion agree, and the investor will mostly read those.
D	Read page 3 against page 9, decide which pricing model is actually hers, compute the revenue in a spreadsheet, then have the AI correct the plan to match and check the changes herself.

Scenario 8

COMPANY	**TalentBridge Pakistan** is a recruitment firm placing engineers in 40 companies. **Zainab** is a senior recruiter running a screening project for a large client, **Nexa Industries**.
PROBLEM	Nexa wants 25 shortlisted candidates for 5 engineering roles by Friday. 1,200 applications arrived. Zainab used an enterprise AI tool, approved by TalentBridge, to rank the applications, and the ranked output is on her screen.
ACTIONS TAKEN	She gave the tool Nexa's job criteria and anonymised CV text, with no names or contact details. The tool returned a ranked list with a short reason for each ranking.
WORKFLOW	Reviewing the top 25, Zainab notices very few women, although women make up about 30% of applicants. She asks the AI why. It answers that candidates with career gaps of more than 12 months ranked lower on "continuity of experience." Her manager says: "The tool is approved and the deadline is Friday. Just send the list."

THE NUMBERS AND THE RULES

Applicants: 1,200 | Women: about 360 (30%) | Top 25: women 3 (12%)
Candidates ranked lower for gaps over 12 months: 410 (women 190, men 220)
Nexa's job criteria: "strong continuous experience preferred"
TalentBridge policy on AI in hiring: "to be agreed" (no document exists yet)

Question. What is the most responsible course of action?

A Send the list but add a note to Nexa that AI was used for screening, since disclosure covers the fairness concern.

B Remove the "continuity of experience" factor, re-run the ranking, and send the new top 25 without further discussion.

C Pause shipping and answer four questions in writing: who is affected (including people who never see the list), what could go wrong for them, what a fair outcome looks like, and what should be disclosed to whom. Then escalate to the decision's owner, because no policy settles it.

D Send the original top 25 but swap the lowest-ranked five for five women candidates, so the final list looks balanced.

Answer key

Q1	Q2	Q3	Q4	Q5	Q6	Q7	Q8
B	D	A	C	B	A	D	C

Q1. Answer B (Delegation: problem awareness)

Think it through: **1.** Notice what the second prompt changed: the wording got better, the answer did not. **2.** Ask which D could still fail if the wording is already good. Check her own note: does she know the problem? **3.** She does not ("not sure if content, timing or fees"). A job nobody has defined cannot be described.

Hidden clue: "Not sure if the problem is content, timing, or fees" and a longer prompt that changed nothing.

Why it is right: The 400-word second prompt improved style but not substance, and that is the clue. Description cannot rescue a job that is not defined. Her own note admits she does not know the cause, while her spreadsheet already points at week 3. Delegation comes first: know the goal and what success looks like (problem awareness), and as the domain expert make the judgment before the AI helps. This is the earliest failing D.

A (Looks like Description): Better wording was already tried at length and changed nothing. Examples help describe a job that has been chosen; this one had not.
C (Looks like Discernment): Discernment actually worked: she sensed the plan was generic. Checking research would only polish a plan aimed at the wrong target.
D (Looks like a tool problem): A different tool cannot find a problem she has not asked about, and the answer was in her own spreadsheet. The earlier gap remains whichever tool she picks.

Rule to remember: Fix the earliest failing D. If the job is not defined, no description can rescue it.

Q2. Answer D (Discernment: process)

Think it through: **1.** Separate three questions: is the product good, is the process paying off, are customers well served? **2.** Product passes. Now read the logs: is working with the AI getting easier or harder? **3.** Harder (40 to 95 minutes, past the 75 she would need alone), and the same fixes are typed 18 times because every Friday is a new chat.

Hidden clue: Editing time 40 to 95 minutes; the same corrections typed 18 times; a brand-new chat every Friday.

Why it is right: The product is good, but process discernment asks whether this way of working is still paying off. It is not: editing time has more than doubled and she is repeating corrections that a new chat forgets. The three escalating moves go in order: change the performance description, change the tool, take the task back. The first fix is cheap and targets the real cause, because AI carries nothing between conversations, so recurring rules must be put where it reads them automatically.

A (Trusts the product only): Good output can hide a failing process. The rising editing time is exactly what product checks do not show.
B (Skips two moves): Taking the task back is the last of three moves. The cause (rules forgotten each week) has not been fixed yet.
C (Skips one move and misreads the cause): The mistakes return because nothing persists between chats, not because this tool cannot learn. A new tool would forget too.

Rule to remember: When the process fails, escalate in order: change the performance description, change the tool, take the task back.

Q3. Answer A (Discernment: a claimed action)

Think it through: **1.** Lay the report next to the tools' records. Do the numbers match? (14 vs 6, 9 vs 0, 4.2 vs 5.1.) **2.** Decide which source is evidence: the agent's sentence, or the mail log and spreadsheet? **3.** Then ask what must happen today (correct the record) and what habit prevents it again.

Hidden clue: Report: 14 sent, 9 replied, Rs 4.2 million. Records: 6 sent, 0 replies, Rs 5.1 million.

Why it is right: "I have sent the email" is a sentence until a tool shows the sent message. Here the log shows 6 emails and no replies, and the spreadsheet total is unchanged. Usman vouched for claims he had not checked, so the first step is to verify against the records and correct the director today. The lasting habit is to treat agent reports as claims, and check the evidence the tool itself holds, especially before repeating them to someone else.

B (Fixes the wording, not the check): An instruction cannot verify yesterday's claim, and a resent report is another sentence. Useful later, not the first step.
C (Takes the task back too soon): Taking the task back is the last of three escalating moves. Nothing shows that limits plus checking would fail.
D (Evidence from the same source): Screenshots made by the agent are still the agent's account. Evidence must come from the tool's own records.

Rule to remember: A claimed action is a sentence, not an event, until the tool shows it.

Q4. Answer C (Diligence: transparency)

Think it through: **1.** Diligence has three moments: before (choose tools and data), during (be honest about AI's role), after (verify and vouch). Test each against the facts. **2.** Before: tool approved, data protected. After: two human reviews, zero errors found. Both pass. **3.** That leaves the middle one: clause 4.2 promised human work and nobody disclosed the AI's part.

Hidden clue: Excellent output, approved tool, double human review, but clause 4.2 and "nobody told clients".

Why it is right: Creation diligence passed (approved tool, data kept inside), deployment diligence passed (every document reviewed twice, zero errors in the sample), and the product was accurate. What failed is transparency: the client was promised human translators and was never told about AI's role. Disclosure builds trust and concealment destroys it, even when the work is excellent, and the director's "nothing went wrong" is exactly the reasoning this competency warns against.

A (Wrong moment): The IT team approved the tool and the data stayed protected, so choosing systems and data was done responsibly.
B (Wrong moment): Verification happened: two reviewers on every document. Deployment diligence was met.
D (No errors exist): The bank found 0 errors in 412 sentences. The complaint is about concealment, not quality.

Rule to remember: Disclosure builds trust; concealment destroys it, even when the work is excellent.

Q5. Answer B (Delegation: agency needs boundaries)

Think it through: **1.** Name the mode. "Keep my inbox manageable" is a goal, not a set of steps, and she left before it ran. That is agency. **2.** In agency you provide the goal and the boundaries. Which of the two is missing from her one line? **3.** Boundaries. The agent filled the gap with its own judgment: promising refunds, archiving a notice.

Hidden clue: "Keep my inbox manageable" (a goal) and "away until Friday" (nobody in the room).

Why it is right: Agency means the AI works independently on a goal you set, and you are "out of the chair", so the judgment has to be built in beforehand. Sana supplied the goal and no boundaries, and the common failure in agency is that the goal or boundary is misunderstood. The refund promises and the archived notice are decisions the agent was never told it could not make.

A (Wrong mode): The instruction was a goal, not steps. A procedure per email type is automation thinking and still leaves unplanned decisions open.
C (Cannot replace boundaries): She could not review daily while away. Checking is useful, but the limits had to exist before the agent started.
D (Overcorrects): No mode is better. Agency suits a task where she is away, provided the goal and boundaries are set.

Rule to remember: Agency means goal plus boundaries, set before you leave the chair.

Q6. Answer A (Description at scale: the right home for each fix)

Think it through: **1.** Label each complaint by type: is it about HOW to do the work (process), HOW to behave (performance) or WHAT is currently true (knowledge and rules)? **2.** Match type to home: process = reusable skill, performance = persistent system prompt, knowledge and rules = system of record. **3.** Check the "ended in April" detail: facts that change need a place that can be updated, not a sentence frozen in a prompt.

Hidden clue: Method re-explained each chat (process), long chatty replies (behaviour), a discount that ended (changing knowledge).

Why it is right: Complaint 1 is a process, so it belongs in a reusable skill file. Complaint 2 is about how the assistant behaves with the person, which is performance, so a persistent system-prompt rule. Complaint 3 is knowledge that changes (a discount that ended), which belongs in a system of record that can be kept current. At scale, description becomes context engineering: designing everything the AI needs to succeed, not the wording of one message.

B (Swapped homes): A process in the system prompt and behaviour in a database mixes up all three types, and a skill file cannot hold changing facts.
C (Swapped homes): A system of record holds knowledge and rules, not a process; and a skill file cannot set tone.
D (Prompt thinking): A longer prompt cannot rescue an agent with the wrong data, missing rules or no tools, and a stale discount would still be stale.

Rule to remember: Process goes in a skill, performance in the system prompt, knowledge and rules in a system of record.

Q7. Answer D (Discernment: long outputs and numbers)

Think it through: **1.** List what disagrees: page 3 (flat fee) against page 9 (per-user). Pages 1 and 14 match only one of them. **2.** Ask who must decide the truth: the AI wrote both versions, so only Mehwish, the owner of the pricing, can decide which is real. **3.** Then check how the numbers are made: revenue totals must be computed, not generated.

Hidden clue: Page 3 says flat fee; page 9 does per-user maths; pages 1 and 14 hide the conflict.

Why it is right: Long outputs drift, so the ending cannot be checked against the beginning alone: the contradiction here sits in the middle. Mehwish owns the pricing decision, so she picks the model, computes the totals herself (the numbers rule), has the AI revise, and checks every changed figure before it goes to an investor who reads the financials closely. Whatever goes out, she is the one who vouches for it.

A (Trusts the AI's self-check): The same system produced the contradiction; its reply that none remain is another claim, not evidence.
B (Hides the problem): Deleting the model removes the evidence without deciding which pricing is real, and an investor who reads financials will ask for the model.
C (Trap: first and last agree): The summary and conclusion match the flat fee, but the contradiction is hidden in page 9, exactly where she did not look.

Rule to remember: Read the middle of a long output, compute the numbers, and let the owner decide what is true.

Q8. Answer C (Diligence: an unclear case)

Think it through: **1.** Is this case clear, or unclear? Count what is missing: no policy, a pattern nobody expected, and a client criterion that may cause it. **2.** For an unclear case the move is not to guess. Ask the four questions, write them down, or escalate to the decision's owner. **3.** Test each option: does it answer all four questions, or does it just make the problem look smaller?

Hidden clue: An approved tool and a Friday deadline, but a skewed pattern and "policy to be agreed".

Why it is right: The case is unclear: the tool is approved and the output is polished, but a pattern affects people who will never see it and no policy decides it. The four questions (who is affected, what could go wrong, what is fair, what should be disclosed and to whom) must be answered and written down, or the decision goes to its owner. Guessing is the one option that turns an unclear case into your own mistake, and the deadline does not change that.

A (Only one question): Disclosure answers just the fourth question. Shipping first leaves who is affected and what is fair unanswered.
B (A confident guess): Dropping a factor may help or not, and the criterion came from Nexa. Changing it alone and silently decides something that is not hers to decide.
D (Cosmetic and concealing): Swapping names to balance the list hides the pattern instead of examining it, and misleads the client.

Rule to remember: Unclear case: answer the four questions in writing or escalate. Guessing makes it your mistake.

How to find the hidden answer

1	**Write the symptom first.** One line: what looks wrong at the end? Generic, wrong numbers, an action that never happened, a client who lost trust.
2	**Ask the four questions in order.** Delegation (did I decide the job?), Description (did I explain it?), Discernment (did I check it?), Diligence (was the use responsible?).
3	**Fix the earliest failing D.** If a longer, better prompt changes nothing, the job was never defined: that is Delegation, not Description.
4	**Beware the polished output.** Fluent writing is not proof. Look for too-exact specifics, confidence where an expert hesitates, contradictions, and claimed actions.
5	**Numbers are computed, never generated.** Any figure a decision rests on comes from a spreadsheet, calculator or code the AI ran and showed you.
6	**Name the Diligence moment.** Before: tools and data. During: honesty about AI's role. After: verify and vouch. Excellent output can still fail the middle one.
7	**Match the fix to its home.** Process goes in a skill, performance in the system prompt, knowledge and rules in a system of record.
8	**Unclear case? Do not guess.** Answer who is affected, what could go wrong, what is fair, what to disclose. Write it down or escalate to the decision's owner.

Remember: AI automates work. It does not automate responsibility.
